Manager, Program-C Distribution List

Subj: POPPY Augmentation Meeting; report of

A POPPY augmentation meeting was held at 0930, 16 October, 1970 in the Hoffman Building. Following is the list of attendees:

MR. DIX MR. MAYO MR. HELLRICK MR. PRICE LTJG MORGAN MR. ABPLANALP

Program Manager Program Manager's Office Program Manager's Office/NRL NRLNRL

NRL NSG NSA NSA NSA NSA'

- The meeting was held to discuss planning necessary to ensure an orderly augmentation of the POPPY ground sites, authorized by Dr. McLucas, acting for DEPSECDEF Packard. It was agreed to establish working groups, along functional lines, which would coordinate joint efforts required. These working groups will meet at regular intervals, and will submit written POA&Ms to the Program Manager, for further dissemination to Additional reports required from the all concerned. working groups concern actions initiated, milestones met, slippage in schedules, and similar matters which would impact on the program.
- The following Working Groups, with indicated membership, were deemed necessary:
 - Computer Working Group

Mr. Hellrick - NRL (Chair) Mr. Hammerstrom - HRB

b. PDE Working Group

Mr. Price - NRL (Chair)

Mr. Fisher - NRL

Mr. Hammerstrom - HRB

Working Group

LCDR. McGraw - NSG (Chair) LTJG Morgan - NSG Mr. C. Price - NRL

Mr. Withrow - NRL

Mr. G. Price - NRL

Mr. Hellrick - NRL (NSA Membership - to be determined)

4. The first meeting of the Computer Working Group and the PDE Working Group was scheduled for 26 October 1970. The first meeting of the Working Group will be announced at a later date.

- 5. It was agreed that NSG and NSA would work together on such matters as CCP programming, keeping the Program Manager advised on all relevant matters. It was further agreed that NSG would prepare a draft message outlining action items required by various commands to ensure an orderly progression of the schedule. This message would be transmitted from CNO to relevant commands, and would serve as the official authorization for proceeding with the implementation of the augmentation authorized.
- 6. There being no further agenda items or discussion, the meeting was adjourned.

Approved for Release: 2024/06/12 C05026159

II- Due to the delay in the distribution of the intermal Job Order Status Reports by the NRL Comptoller shop the MSR will report on a cost base about 5 to 6 weeks after the fact. These JOSR reports are of a fixed format and not the one required by NRO comptoller for Program C. However an attempt will be made to convert the cost format of the MSR to the NRO format ... I- Payload, II- Ground Station

For the period end ng 10/31/70 (FY-71) the entire Program C effort at NRL is summarized as follows:

Scientific Routine Costs:		Cumulative Hours	Current Costs	Cumulative costs
Straight Time Pay Overtime		35,303 8,038	\$85,908 14,297 84,974 616	\$336,507 60,476 495,951 12,365
Service Division Support: ESD Pay	6,645	23,106	\$37,949	\$132 , 528
ESD Non-Salary Other Pay	356	1,479	15,510 2,000 10,509	65,426 8,501 42,267
Applied Overhead:				
Gen & Adm			82,273 17,637	324,844 69,937
Subtotal Routine:		4	351 , 673	\$1,548,802
MAJOR PROCUREMENT. (Over.\$5	,000.ea)	•	314,866	2,795,563
TOTAL	. 635	4	\$666 , 539	\$4,344,365

Note: The Subtotal Routine for the first $\frac{FY-71}{3}$ is \$1½M.

The \$1,220,500 for Augmentation of Program 6 when taken from the Balance leaves Balance of \$3,484,185. Now if we linearly extrapolate the subtotal Routine this will demand that \$3 M be retained for these salary and routine purchase type expenses leaving only \$386,581 for major procurements after 1 November (except for the Augmentation funds). Thus the budgetary deficiency had severely curtailed major procurements until 9 December when we were informally informed that the defeciency was being supplemented and at this time the subtotal routine funds were available for use in procurements of a major amount.

Other architecture changes in Mission 7107 which are proposed in the ELINT Coverage of Table #1 are as follows:

Complete frequency coverage from 154 to 18 GHz in direct response to emphasis by NRO staff on numberous occasions.

Extended Geopositioning capability in K_u band as requested by NSA & NRO to satisfy the emitter requirement.

Band #8 of the 7107A & B spacecraft has been raised from 2800 to 2840 with the more adequately embrace the emitter signal.

Note that these improvements to the design concept for Mission 7107 do indeed improve the overall concept and in so doing they do enhance in a number of ways the capability for Ocean surveillance by this mission.

NIC metter to the NRO of 17 August proposing the augmentation of the Program C in support of Ocean Surveillance, concentrates on improvements at the overseas sites and the addition of the first operational These/improvements/are tor new CONUS site at or Second-Generation Computer and Hardware sorting system to make the computer available for processing data from certain selectable spacecraft collection systems or Bands. The computer system has by virtue of its increased speed alone, the potential of a factor of 40 to 50 improvement beyond that currently being used at the sites in for Program C on-site processing. Therefore the arenas where the greatest improvement in Grean Surveillance capability is anticipated are (1) timeliness/of reporting mobile speed and power on, (2) the on-site hardware sorting ability which can make X-Band available for timely local-processing. (3) CONUS site dedicated to Ocean Surveillance operations and training.

Top Secret

III- Budget Revision of Ref (a)

A- Reasons for revision

Failure analysis on Mission 7106 more demanding than estimated. Costs inflated beyond those of 7106 which was basis of estimee. Extension of the technical goals of the Mission beyond than used in Ref (a).

R&D Spacecraft never priced out before.

B- Deficit in FY-71 Funding at NRL

C- FY-72 estimate for Mission 7107.

D-

16 month

Table #2 gives the new/revision of the last third FY-70 plus FY-71 estimates for funding required for Mission 7107. Table 3 gives Mission 7107 cost estimate for FY-72 Several factors have caused revision of the budget estimate of Reference (a):

(1) The failure analysis of the two spacecraft which suffered in-flight command system loss in Mission 7106 in February 1970, required much more extensive analysis than was estimated in Reference (a)

the costs shown in Column #1 of Table 2 indicates these expenses. This failure analysis was imperative before the design of Mission 7107 could proceed with confidence.

- (2) Another factor in the requirement for budgetary revision of Mission 7107 has been the manner and extent of the cost inflation now being experienced. Ref (a) used the 7106 development as the mass for cost estimate for Mission 7107 and now that the market place has been sampled for this development cycle it is painfully apparent that the costs have risen far beyond that anticipated in Ref (a). Column #2 of Table #2 delineate these inflationary costs.
- (3) The changes in the design concept and design goals through increased operational requirements on Mission 7107 beyond those imposed at the time of Ref (a) are shown priced out in Tolumn #4 of Table #2. Specifically these costs are itemized in Table #3. Note that the Payload with \$260K being devoted portion of these costs totals to \$495K, ... to improvements in the frequency spectrum above 101/2 GHz, . . for general search as well as for emitter geopositioning. The USIB requirement and the NRO requirement for Mission 7107 have imposed this change since the submission of Ref (a). Parametric/Versatility requirements have been imposed by NSA in order to improve the processibility of Brogram C parametric measurements. In the past these capabilities have had for each individual collection system, its own unique calibration characteristic. Thus precluding the computerized reduction of the data. In Mission 7107 the design goal is for each collection system's parametric measurement calibration to be identical with that of the other parts of the spectrum, and also to embrace a much wider dynamic range so that the amplitude measurements, for example, can define the first order side lobes as well as the main beam.

In addition to these increased operational requirement being imposed on Mission 7107 beyond those invisioned at the time of Ref (a) there are two more. (1) A ranging system between the operational spacecraft to enhance the capability of monitoring the in-flight orbital station-keeping microthruster action. This will also pioneer for this program the essential elements of spacecraft-to-spacecraft communications for what ever Slave/Master arrangement it might imply. This is a first natural step toward relaving Program "C" data via another high altitude system back

	the other area of technical intensification Lag	in the program
has	occured by	the reflection on
the	spacecraft command system of a requirement mxx	for twice as many
oper	ational commands as were available in Mission 7	7106. Thus Mission
7107	will have 160 discrete operational commands av	vailable in each of
the	primary spacecraft as compared to only 80 avail	able in Mission 7106

So fat the areas of the spacecraft have been discussed relative to the intensified operational requirements being imposed on the program. There are several anrea where the ground collection xmxtmmxmxm analysis xmxtmmxx and data-delay calibration systems must be improved...(1) the requirement placed upon the overseas sites to perform a Quality Assessment, Initial data scan for Signals Of Interest (SOI), using the magnetic tape recordings made for NSA analysis, has brought about a dangerous balance between doing the job quickly to get the tape off to NSA and doing the job well and thoroughly. These are both desirable but not compatible so improvement is essential in these vital part of our operations. It has been determined that a Uniform QC-Complex and Standard Operating Proceedure should be developed for all sites so that the measurements will all be made alike, with the same resolution accuracy....\$125K is required to complete this vital improvement in the collection and Quality Assessment part of the Program "C" ground systems.

- (2)In the past there has been a "Calibration Signal" recorded on the beginning or at the end of each data tape so that the analysis community could determine the preciese delay values associated with each receiver channel; thus improving the overall measurement of by giving a calibration value of the instrumental error. This calibration signal has not been immune to the environment of the collection site since it reflects the noise seen through the antenna. A modification is proposed to isolate the antenna moise from this calibration data. Anéstimated \$12x \$25K is meded to carry out this important improvement to the system.
- (3) the System Quick-Check at each site is made printminimum weekly and involves sending a signal from the operator position out a coaxial line to a direction coupler at the base of the antenna so that a known signal is fed into the input of the receiving system just below the receiving antenna. This system has been used for years and periodically it has been found to inadequately describe the system readiness...particularily in the area beyond the direction coupler, the receiving anderna system and its coaxial cable phaseing harness. It has been proposed that a small test antenna be installed remote from the precent data receiving antennas, so that the test signal can be radiated into the receiving system through the receiving system through

28 October 1970:

FROM: DIRECTOR, NAVAL RESEARCH Laboratory

Washington P.C. 20390

TO: Director, Program "C"

Subj: Technical and Budgetary Briefing (FY-71) for Mission 7107 given

To NRO Staff on 26 October by NRL Briefing team.

1. R&D Spacecraft for Mission 7107, Technical Proposal for.

weighting each of these categories of Threat there was a stated requirement for timeliness and accuracy and probability of intercept. Examination of these requirements shows that Program "C" demonstrated capability to date does not meet the probability of intercept requirement and on certain of the intercept geometries the accuracy is not adequate. These shortcomings in the present Program "C" system are therefore important considerations in the design concepts for an R&D Spacecraft to be launched along with Mission 7107, and used in a fashion to enhance the overall operational capability for the total mission.

Thus a Hybrid System utilizing both the primary spacecraft of Mission 7107 and an another R&D spacecraft has been developed. The R&D spacecraft will contain among other systems, a

Secret CONFIDENTIAL

MEMORANDUM

From: E. L. Dix

To: H. O. Lorenzen

Subj: Interim Systems Analysis Group, suggested tasks for

- 1. The requirements for Program C systems analysis tend to fall into two related but distinguishable categories. On the one hand, an immediate need exists to study and improve the performance of the system as it exists today. At the same time, the response of NRL to the basic USIB requirements must be reviewed from a long range point of view so that advances in technology and the increased capability of NRL can be combined to provide the best possible system performance to meet both national and ocean surveillance needs now and in the foreseeable future.
- 2. The following items are suggested under the category of present system improvement possibilities. This list is by no means complete nor has any attempt been made to assign priorities.
 - a. Re-evaluate all sources of error, identify relative contribution to location error, and recommend hardware or software changes required to reduce end product errors and reduce processing time.
 - b. Study propagation anamolies and polarization diversity, particularly with regard to channel A reception and command transmission. This effort should also examine a new D. L. frequency.
 - c. Examine system changes required to reduce the requirement for averaging to obtain acceptable location accuracy. The goal of this effort would be to approach monopulse location capability.
 - d. Perform trade-off analysis of brute-force numerical augmentation of Program C, both in air and on ground, to improve time over target and probability of intercept. Make cost effectiveness comparison with other programs.
 - e. Investigate possible means of improving SPASUR data transmission techniques to improve quality of ephemeris data.

- 3. The suggested list of study topics in this paragraph are primarily directed toward the formulation of future concepts. Again no claim is made for completeness or priority ordering.
 - a. Explore feasibility of adding high sensitivity downward looking conical or fan beam coverage to provide measurements of intercept toroid now used. Probably would require slanting coverage The goal here would be to provide horizon to horizon location capability with about equal accuracy in selectable bands.
 - b. The possibility of providing downward location capability using true mono-pulse techniques should be investigated for ocean surveillance coverage. This would supplement present techniques as in (a) above.
 - c. Study the problems associated with relay of data via a high altitude or synchronous or semi-synchronous satellite. Will involve programmable pointing of directional antenna from spacecraft. Probably need stiffer 3 axis stabilization system.
 - d. Investigate on-board digitizing and processing for both techniques. Compare to ground processing.
 - e. Examine impact of providing a direct transpond 5MHZ BW frequency translated data down link for selective use to produce technical information on new targets.
 - f. Study the problems associated with frequency translating a number of bands into a common frequency measuring system for selectable use.
 - g. Study application of other than ELINT sensors for meeting the requirements for ocean surveillance. Include data handling aspects of each.
 - h. Examine presently available ocean surveillance data collection systems as a guide to providing most needed additional information.

i. Compare direct transmittal of ocean surveillance data to Fleet Flagships, etc., versus relay to CONUS and retransmittal to the fleet via conventional communications channels.

- 4. Although many of the items listed reflect the thoughts of a number of people in Program C, a planning meeting with the key NRL people would be helpful in expanding or otherwise modifying this list. Of particular urgency is the need to assign priorities to the final list and match tasks with people so work can start.
- 5. In anticipation of having such a meeting, I am sending a copy of this memorandum to Reid Mayo, Pete Wilhelm, and Capt. so they may be prepared in advance. If you consider it appropriate, a copy can be sent to so that he will be aware of NRL's activities in this area.

MEMORANDUM

From: E. L. Dix

To: H. O. Lorenzen

Subj: Interim Systems Analysis Group, suggested tasks for

- 1. The requirements for Program C systems analysis tend to fall into two related but distinguishable categories. On the one hand, an immediate need exists to study and improve the performance of the system as it exists today. At the same time, the response of NRL to the basic USIB requirements must be reviewed from a long range point of view so that advances in technology and the increased capability of NRL can be combined to provide the best possible system performance to meet both national and ocean surveillance needs now and in the foreseeable future.
- 2. The following items are suggested under the category of present system improvement possibilities. This list is by no means complete nor has any attempt been made to assign priorities.
 - a. Re-evaluate all sources of error, identify relative contribution to location error, and recommend hardware or software changes required to reduce end product errors and reduce processing time.
 - b. Study propagation anamolies and polarization diversity, particularly with regard to channel A reception and command transmission. This effort should also examine a new D. L. frequency.

c. Exam	ine system	changes	required	to	reduce	the requi	re-
ment for			averaging	to	obtain	acceptabl	. 0
	accuracy.	The go				ould be to	•
approach			capabil	Lty	•		

- d. Perform trade-off analysis of brute-force numerical augmentation of Program C, both in air and on ground, to improve time over target and probability of intercept. Make cost effectiveness comparison with other programs.
- e. Investigate possible means of improving SPASUR data transmission techniques to improve quality of ephemeris data.
