1. INTRODUCTION

The purpose of this document is to describe the mathematical models, capabilities, and detailed computational methods of the TSPOOND study computer program. The information contained in this document is intended to supplement the TSPOOND User's Manual (Reference 1) by providing, in detail, the logic and computational methods employed by the program.

Section 2 of this document describes the mathematical models and capabilities. Section 3 contains descriptions of the program sub-routines including computational methods and detailed flow diagrams. TSPOOND usage and operating instructions along with required program interfaces may be obtained from Reference 1.

The version of the TSPOOND program currently being used resides on the SOFT 11-05 U flight support tape along with the study program TWONDER and its environment. This tape has been copied and delivered to SAMSO and contains the following programs:

<u>Element No.</u>	<u>Name</u>	<u>ID, Mod</u>	<u>Codes No.</u>

Element numbers 1 through 5 are SDC programs. Element 7, TBCD and 9, TDETAIL are part of TDISPLAY's operating environment. TWASSP1 is a table generating program used in TWONDER checkout, and TWLIST is a secure tape listing program. The remaining programs, except for TSPOOND, have specific TWONDER functions. TSPOOND can operate as a stand-alone program, but a prerequisite run must be made on TWONDER to generate a BIT containing the optimum target acquisition strategy for the main optics and the acquisition telescope(s). TSPOOND requires the BIT as a primary input. Consequently, TSPOOND and TWONDER environments have been placed on the same flight support tape.

## 2.0 TSPOOND MATHEMATICAL MODES

### 2.1 GENERAL DISCUSSION

The purpose of the computer program TSPOOND (Statistical Program of On-Board Decisions) is to simulate the actual conditions of target visibility and activity, crew voting and consequent main optics selections for the MOL/DORIAN missions. Two general types of results are generated over a given rev span: (1) typical sample information describing crew performance, target visibility and activity, and main optics selections, and (2) statistical summary data of specified output parameters derived from a specified number of samples including the means, variances, maximum and minimum values.

TSPOOND accomplishes the simulation using a Monte Carlo technique, sampling at random certain variables such as target visibility, activity, scope dwell times, crew recognition and false alarm. Using the path selections for the main optics and acquisition telescopes from the TWONDER BIT, TSPOOND simulates the effects of different crew voting strategies and other relevant factors on overall mission results.

A basic flow diagram showing the hierarchy of operations is shown in Figure 2-1.

## 2.2 MONTE CARLO APPROACH

The Monte Carlo technique employed in TSPOOND answers questions about various mission results by constructing a random process corresponding, as close as possible, to what a typical mission is like. The program accomplishes the simulation by representing the relevant physical and performance parameters as random variables. The cumulative distribution functions for the random variables are chosen based on historical data. The specific random variables used in TSPOOND are listed in the following table.

<u>Variable</u>	<u>Description</u>
V	visibility of a target (V=1 target visible; V=0 not visible)
$\delta t$	scope dwell time
$\alpha$	target activity ( $\alpha=1$ target active; $\alpha=0$ target inactive)
$\xi$	astronaut recognition of target activity ( $\xi=1$ recognition; $\xi=0$ failure to recognize)
$\eta$	astronaut false alarm, i.e., reporting a target active when it is actually inactive ( $\eta=1$ false alarm; $\eta=0$ correct report)

On the basis of these random variables, the program can effectively simulate a mission, and hence determine those parameters which depend on the random variables. Thus the mission parameters of interest are also random variables which depend in a complex way on those listed above. If the dependence were simple, an analytic approach could be utilized to immediately determine the statistical properties of the pertinent mission parameters. If, as in the present case, the dependence is complex, the Monte Carlo approach provides an effective means.

Basically, the Monte Carlo approach repeats the complete mission a large number of times (each repetition called a cycle) and tabulates the variations in the parameters of interest. For example, if  $r$  represents one such parameter,  $r$  is a function of the  $V_i$ ,  $\delta t_i$ ,  $\alpha_i$ ,  $\xi_i$  and  $\eta_i$  where the subscript  $i$  ranges over  $N$ , the number of targets involved, i.e.,

~~SECRET/D~~

~~SECRET/D~~

$$r = f(V_1, \dots, V_N; \delta t_1, \dots, \delta t_N; \alpha_1, \dots, \alpha_N; \xi_1, \dots, \xi_N; \eta_1, \dots, \eta_N).$$

If the program then processes M cycles, M different values of r result,  $r_1, \dots, r_M$ . The statistical properties of r are then inferred from the sample values. An approximation to the mean of r, for example, is found from

$$\bar{r} = \frac{1}{M} \sum_{j=1}^M r_j$$

and the variance from

$$\sigma^2(r) = \frac{1}{M} \sum_{j=1}^M (r_j - \bar{r})^2$$

The program also records the largest and smallest value assumed by r over the M cycles.

~~SECRET/D~~

~~SECRET/D~~

### 2.3 RANDOM NUMBER GENERATORS

Two types of random number generators (RNG) are used by TSPOOND to generate the (pseudo) random numbers needed to compute the values of the random variables involved in the Monte Carlo sampling:

(1) a zero-one generator, and (2) a generator that samples from a triangular density function. Both of these RNG use a subroutine RDMLJ (section 3.24) which computes random numbers between 0 and 1 with a uniform distribution. The two RNG are described below.

#### 2.3.1 Zero-One RNG

Many of the variables in the program are so-called "zero-one" random variables that assume the value 1 with some probability  $\alpha_1$  and 0 with probability  $1 - \alpha_1$ . If  $Z$  is such a variable, its value for each sample is determined by obtaining a number  $r$  from RDMLJ falling between 0 and 1 and comparing it with  $\alpha_1$ . If  $r < \alpha_1$ ,  $Z$  is set to 1. If  $r \geq \alpha_1$ ,  $Z$  is set to 0.

That  $Z$  has probability  $\alpha_1$  of being equal to 1 follows from:

$$\Pr\{Z = 1\} = \Pr\{r < \alpha_1\} = \frac{\alpha_1}{1} = \alpha_1$$

since  $r$  is uniformly distributed on  $[0, 1]$ .

#### 2.3.2 Triangular Density RNG

The simulation of the acquisition scope dwell time requires the generation of random variables with a specified triangular density function. Let  $f$  be the required triangular density function with mean  $Q$  and let  $r_1Q$  and  $r_2Q$  be the two base points (See Figure 2-2).

~~SECRET/D~~

~~SECRET/D~~

Figure 2-2. Dwell Time Probability Density Function

Since  $f$  is a density function, the area of the triangle must equal 1. Thus, the altitude  $h$  is given by

$$1 = \frac{1}{2} (r_2Q - r_1Q)h \quad (1)$$

or

$$h = \frac{2}{Q(r_2 - r_1)} \quad (2)$$

Thus, the definition of  $f(x)$  is

$$f(x) = \begin{cases} \frac{h(x - r_1Q)}{Q(1 - r_1)} & \text{if } x \leq Q \\ \frac{h(r_2Q - x)}{Q(r_2 - 1)} & \text{if } x > Q \end{cases}$$

~~SECRET/D~~

The distribution function for  $x$  is then given by the integral of  $f$ ,

$$F(x) = \int_{-\infty}^x f(t)dt = \left\{ \begin{array}{ll} \frac{h(x - r_1Q)^2}{2Q(1 - r_1)} & \text{if } x \leq Q \\ 1 - \frac{h(r_2Q - x)^2}{2Q(r_2 - 1)} & \text{if } x > Q \end{array} \right\}$$

One property of  $F$  as a distribution function then guarantees that if a random variable  $r$  with uniform distribution on  $[0, 1]$  is generated, the variable  $T = F^{-1}(r)$  will have the distribution function  $F$ . TSPOOND uses this method of generating the variable  $T$  with the required triangular density function.

Dwell Time

Figure 2-3. Dwell Time Cumulative Distribution Function.

Solving for  $T$  from the inverse of  $F$  yields

$$T = \left\{ \begin{array}{ll} r_1Q - \sqrt{\frac{2Qr(1 - r_1)}{h}} & \text{if } r \leq \left( \frac{1 - r_1}{r_2 - r_1} \right) \\ r_2Q - \sqrt{\frac{2Q(1 - r)(r_2 - 1)}{h}} & \text{if } r > \left( \frac{1 - r_1}{r_2 - r_1} \right) \end{array} \right\} \quad (3)$$

~~SECRET/D~~

#### 2.4 ACQUISITION SCOPE SIMULATION

The amount of time that a crew member spends viewing a target is a variable that depends on whether or not the target is visible, and, if visible, on whether or not the crew member notices activity. TWONDER uses a recommended dwell time for each target which is then transmitted to TSPOOND on the Binary Interface Tape. If the target is clear, TSPOOND uses the TWONDER recommended dwell time,  $\delta t_R$ , as a basis for determining a triangular density function,  $f$ , for the sample dwell time,  $\delta t$ . If the target is cloudy, the density function  $f(\delta t)$  will be determined entirely from parameters input on the TSPOOND function card.

More precisely, if the target is visible, two ratios,  $Q_1$  and  $Q_2$  are read from the function card, and  $f(\delta t)$  has the following form:

Figure 2-4 Dwell Time Density Function When Target is Clear

~~SECRET/D~~

~~SECRET/D~~

If the target is cloudy, three numbers,  $X_1$ ,  $X_2$  and  $X_3$ , are read from the function card and  $f(\delta t)$  has the form:

Figure 2-5 Dwell Time Density Function When Target is Cloudy

The TSPOOND scope on and off times are generated for each group using the sampled dwell times. The time between targets, SST, is approximated by the corresponding time in TWONDER, so that the equations for each scope are:

$$t_{\text{on}}^{(1)} = \bar{t}_{\text{on}}^{(1)}$$

$$t_{\text{off}}^{(i)} = t_{\text{on}}^{(i)} + \delta t^{(i)} \quad i \geq 1$$

$$t_{\text{on}}^{(i)} = t_{\text{off}}^{(i-1)} + (\bar{t}_{\text{on}}^{(i)} - \bar{t}_{\text{off}}^{(i-1)}) \quad i \geq 2$$

where the bar denotes the TWONDER values and the superscripts refer to the target numbers within each group for the scope. The  $\delta t^{(i)}$  is the actual (or sampled) dwell time.

~~SECRET/D~~

~~SECRET/D~~

The situation is illustrated in Figure 2-6.

Figure 2-6 TWONDER and TSPOND Scope on and off Times

~~SECRET/D~~

~~SECRET/D~~

## 2.5 INTRA-GROUP WEATHER CORRELATION

The term "intra-group correlation" refers to the correlation between the visibility of targets within the same group. If one target is known to be visible, the probability that another target within the same group (and hence geographically close) is visible is enhanced. TSPOOND models this correlation by assuming that the correlation between any two targets is the same, i.e.,

$$\bar{\rho} (V_i, V_j) = \bar{\rho} \quad \text{for } i, j = 1, 2, \dots, N \quad (1)$$

where  $V_i$  is a zero-one variable for the  $i^{\text{th}}$  target which is 1 if the target is visible and 0 if not. The probability of visibility  $\bar{P}$  for the targets satisfies

$$\Pr\{V_i = 1\} = \bar{P} \quad \text{for } i=1, \dots, N \quad (2)$$

Thus TSPOOND must generate the  $N$  variables  $V_1, \dots, V_N$  satisfying (1) and (2). To accomplish this, TSPOOND uses the following conditional sampling technique: First an auxiliary zero-one random variable  $C$  is introduced with  $\Pr\{C=1\} = P_c$  and  $\Pr\{C=0\} = 1-P_c$ . Then the distribution functions for the  $V_i$  are determined conditionally so that

$$\begin{aligned} \Pr\{V_i=1 \mid C=1\} &= P_1 & (\Pr\{V_i=0 \mid C=1\} &= 1-P_1) \\ \Pr\{V_i=0 \mid C=0\} &= P_1 & (\Pr\{V_i=1 \mid C=0\} &= 1-P_1) \end{aligned} \quad (3)$$

The basic problem, then, is to determine  $P_c$  and  $P_1$  in order to satisfy (1) and (2).

Equation (2) implies that

$$E(V_i) = P_c P_1 + (1-P_c)(1-P_1) = \bar{P} \quad (4)$$

~~SECRET/D~~

~~SECRET/D~~

The covariance of  $V_i$  and  $V_j$  is given by

$$\text{COV}(V_i, V_j) = E(V_i V_j) - E(V_i) E(V_j)$$

where  $E(V_i V_j) = P_c P_1^2 + (1-P_c)(1-P_1)^2$

and  $E(V_i) = E(V_j) = P_c P_1 + (1-P_c)(1-P_1)$  (5)

So, carrying out the algebra,

$$\text{COV}(V_i, V_j) = P_c(1-P_c)(2P_1-1)^2.$$

Finally, the correlation coefficient between  $V_i$  and  $V_j$  is

$$\rho(V_i, V_j) = \frac{\text{COV}(V_i, V_j)}{\sigma(V_i) \sigma(V_j)} \quad (6)$$

where  $\sigma(V_i) = \sigma(V_j) = E(V_i)[1-E(V_i)]$ .

So (6) becomes (using (2))

$$\rho(V_i, V_j) = \frac{P_c(1-P_c)(2P_1-1)^2}{\bar{P}(1-\bar{P})} \quad (7)$$

Applying condition (1) to (7) yields

$$\bar{\rho} = \frac{P_c(1-P_c)(2P_1-1)^2}{\bar{P}(1-\bar{P})}. \quad (8)$$

Thus the problem reduces to the simultaneous solution of (4) and (8) for  $P_c$  and  $P_1$ .

Letting  $K = \bar{\rho} \bar{P}(1-\bar{P})$  in (8) yields

$$K = (P_c - P_c^2)(2P_1-1)^2 \quad (9)$$

~~SECRET/D~~

~~SECRET/D~~

Solving (6) for  $P_1$ ,

$$P_1 = \frac{\bar{P} + P_c - 1}{2P_c - 1} \quad (10)$$

Returning to (9),

$$K = (P_c - P_c^2) \left[ \frac{2\bar{P} + 2P_c - 2}{2P_c - 1} - 1 \right]^2 \quad (11)$$

or

$$K = (P_c - P_c^2) \left[ \frac{2\bar{P} - 1}{2P_c - 1} \right]^2 \quad (12)$$

Now define

$$K' = \frac{K}{(2\bar{P} - 1)^2} \quad (13)$$

Equation (12) now becomes

$$K' (2P_c - 1)^2 = P_c - P_c^2$$

$$K' (4P_c^2 - 4P_c + 1) = P_c - P_c^2$$

where finally

$$P_c^2 - P_c + \frac{K'}{4K' + 1} = 0 \quad (14)$$

The solution of (14) is

~~SECRET/D~~

~~SECRET/D~~

$$P_c = \frac{1}{2} + \frac{1}{2} \sqrt{\frac{1}{4K' + 1}} \quad (15)$$

Substituting  $P_c$  into (10) results in

$$P_1 = \frac{1}{2} + (\bar{P} - \frac{1}{2}) \sqrt{4K' + 1} \quad (16)$$

Thus the values for  $P_c$  and  $P_1$  in (15) and (16) will guarantee the generation of the  $N$  variables  $V_1, \dots, V_N$  satisfying (1) and (2). This method is particularly convenient for computational purposes because the visibility of the targets in a group can be accomplished by a succession of calls to a simple Bernoulli random number generator.

~~SECRET/D~~

~~SECRET/D~~

## 2.6 INTER-GROUP WEATHER CORRELATION

Inter-group weather correlation refers to the correlation between the visibility of targets in adjacent groups. The model used in TSPOOND assumes that the weather for group  $i+1$  is dependent only upon the weather for group  $i$  but not upon that for any other group. The amount of correlation is determined as a function of the time interval between their group decision times. A quantity  $t_{\max}$  (input on the TSPOOND function card) specifies the time at which the inter-group correlation coefficient falls to 0.

More precisely, define two zero-one random variables,  $V^{(i)}$  and  $V^{(i+1)}$ , representing the visibility of group  $i$  and group  $i+1$  respectively, with

$$\Pr \{ V^{(i)} = 1 \} = \mu_1 \quad (\Pr \{ V^{(i)} = 0 \} = 1 - \mu_1) \quad (1)$$

$$\Pr \{ V^{(i+1)} = 1 \} = \mu_2 \quad (\Pr \{ V^{(i+1)} = 0 \} = 1 - \mu_2) \quad (2)$$

Further let  $\bar{\rho}$  be the specified correlation coefficient between  $V^{(i)}$  and  $V^{(i+1)}$ ,

$$\rho(V^{(i)}, V^{(i+1)}) = \bar{\rho} \quad (3)$$

The variable  $V^{(i)}$  and  $V^{(i+1)}$  satisfying (1) - (3) are generated by a conditional sampling technique. The value of  $V^{(i)}$  is first selected to satisfy (1) and then the value of  $V^{(i+1)}$  is selected conditionally so that

$$\Pr \{ V^{(i+1)} = 1 \mid V^{(i)} = 1 \} = P_1 \quad (4)$$

and

$$\Pr \{ V^{(i+1)} = 1 \mid V^{(i)} = 0 \} = P_2. \quad (5)$$

From equations (1) and (2) and the definition of expectation,

~~SECRET/D~~

~~SECRET/D~~

$$E(V^{(i+1)}) = \mu_2 = \mu_1 P_1 + (1-\mu_1)P_2 \quad (6)$$

Also the variances of  $V^{(i)}$  and  $V^{(i+1)}$  are given by

$$\sigma^2(V^{(i)}) = \mu_1(1-\mu_1) \quad (7)$$

and

$$\sigma^2(V^{(i+1)}) = \mu_2(1-\mu_2) \quad (8)$$

The expected value of the product of  $V^{(i)}$  and  $V^{(i+1)}$  is

$$E(V^{(i)} V^{(i+1)}) = \mu_1 P_1 .$$

Hence the correlation coefficient between  $V^{(i)}$  and  $V^{(i+1)}$  is

$$\begin{aligned} \rho(V^{(i)}, V^{(i+1)}) &= \frac{E(V^{(i)} V^{(i+1)}) - E(V^{(i)}) E(V^{(i+1)})}{\sigma(V^{(i)}) \sigma(V^{(i+1)})} \\ &= \frac{\mu_1 P_1 - \mu_1 \mu_2}{\sqrt{\mu_1(1-\mu_1)\mu_2(1-\mu_2)}} \end{aligned} \quad (9)$$

So from (3),

$$\bar{\rho} = \frac{\mu_1 P_1 - \mu_1 \mu_2}{\sqrt{\mu_1(1-\mu_1)\mu_2(1-\mu_2)}} \quad (10)$$

Thus the problem has reduced to the simultaneous solution of (6) and (10) for  $P_1$  and  $P_2$ . Solving (10) for  $P_1$  yields

$$P_1 = \frac{\bar{\rho}}{\mu_1} \sqrt{\mu_1(1-\mu_1)\mu_2(1-\mu_2)} + \mu_2 \quad (11)$$

Substituting  $P_1$  from (11) into (10) produces

$$P_2 = \mu_2 - \frac{\bar{\rho}}{(1-\mu_1)} \sqrt{\mu_1(1-\mu_1)\mu_2(1-\mu_2)} \quad (12)$$

~~SECRET/D~~

~~SECRET/D~~

The solutions,  $P_1$  and  $P_2$ , given in (11) and (12) must fall between 0 and 1, however. Applying this inherent constraint to (11) yields

$$\frac{\bar{\rho}}{\mu_1} \sqrt{\mu_1(1-\mu_1) \mu_2(1-\mu_2)} + \mu_2 < 1$$

$$\bar{\rho} < \frac{\mu_1(1-\mu_2)}{\sqrt{\mu_1(1-\mu_1) \mu_2(1-\mu_2)}}$$

and finally

$$\bar{\rho} < \sqrt{\frac{\mu_1(1-\mu_2)}{\mu_2(1-\mu_1)}} \quad (13)$$

A similar computation applied to (12) results in

$$\bar{\rho} < \sqrt{\frac{\mu_2(1-\mu_1)}{\mu_1(1-\mu_2)}} \quad (14)$$

so that the final constraint on  $\bar{\rho}$  is given by

$$\bar{\rho} < \min \left\{ \sqrt{\frac{\mu_1(1-\mu_2)}{\mu_2(1-\mu_1)}}, \sqrt{\frac{\mu_2(1-\mu_1)}{\mu_1(1-\mu_2)}} \right\} \quad (15)$$

The maximum value  $\bar{\rho}$  can have is denoted  $\bar{\rho}_{\max}$ . TSPOOND computes  $\bar{\rho}$  from  $\bar{\rho}_{\max}$  and the time interval,  $T$ , between the group decision times for groups  $i$  and  $i+1$  as follows:

$$\bar{\rho} = \left\{ \begin{array}{ll} 0 & \text{if } T > t_{\max} \\ \bar{\rho}_{\max} \left(1 - \frac{T}{t_{\max}}\right) & \text{otherwise} \end{array} \right\}$$

Thus the correlation coefficient linearly decays to zero at time  $t_{\max}$  from its maximum value  $\bar{\rho}_{\max}$ .

### 3. TSPOOND SUBROUTINE DESCRIPTIONS

#### 3.1 GLOSSARY OF TSPOOND COMMON STORAGE

<u>JOVIAL Symbol</u>	<u>Dimension</u>	<u>Description and Units</u>
ALTERN	5	Array containing the count of active, inactive, reject, unobserved, and total alternate targets over a rev span
ASDT		Actual acquisition telescope dwell time (sec)
AV		Actual visibility flag 0 not actually visible 1 actually visible
AVOT		Vote on reported and active status 0 - no vote recorded 1 - voted active 2 - voted inactive 3 - voted reject 4 - not voted upon (unobserved)
BLNK		Item consisting of all blanks used mainly for output
BTBF	1000	Input buffer for the TWONDER BIT information (first two files)
BUFOUT		120 byte BCD output buffer
CBERN		Bernoulli variable visibility flag taken from previous group (used in the inter-group correlation model) 0 - clouded 1 - visible
CLEART	2	Two cell array containing the count of clear targets with and without interdiction
CNFLG		Conflict flag indicating conflict status of group CNFLG = 0 group contains no targets in conflict with previous group's target selection

~~SECRET/D~~

~~SECRET/D~~

JOVIAL Symbol    Dimension

CNFLG (Cont'd.)		CNFLG $\neq$ 0 Group contains at least one target in conflict with previous group's target selection
CNFLT		Conflict flag indicating conflict status of target CNFLT = 0 Present target <u>not</u> in conflict with previous group's target selection CNFLT $\neq$ 0 Present target in conflict with previous group's target selection
DBITS	15	720 bit array whose bits, when set non-zero, indicate a typical sample detail output is desired on those corresponding rev numbers (e.g., when bit 35 of DBITS is set non-zero typical sample detail output for rev 35 is desired)
DECEPT	7	(0) Number of false alarms (1) Not used (2) Number of failures to recognize (3) Number of false alarm primaries (4) Number of false alarm alternates (5) Number of failure to recognize primaries (6) Number of failure to recognize alternates
DETFLG		Boolean flag used to indicate when typical sample detail output has been written on KSPOUT DETFLG $\neq$ 0 Write end of file on KSPOUT DETFLG = 0 No action taken
DT		Sum of the scope slew and settle time plus actual scope dwell time (sec)
EOF		Boolean flag used to check for end-of-files or end-of-tapes after an I/O operation
EXTBITS		Item whose first 30 bits indicate which extended statistics have been requested of the corresponding 30 summary output parameters
FDET		Boolean flag which, when true, indicates typical sample detail output is desired on the current rev

~~SECRET/D~~

~~SECRET/D~~

<u>JOVIAL Symbol</u>	<u>Dimension</u>	<u>Description and Units</u>
FSUM		Boolean flag which, when true, indicates summary output desired on current rev
F78IT	21	1000 bit array whose bits, when set non-zero, indicate decimal integer output for those corresponding File 7 and File 8 reset parameters
GDT1		Previous group's group decision time in sec (used in the inter-group visibility correlation model)
GN		Present group number
GNMAX		Number of groups on the current rev
ICOM		Current rev span summary being processed by TSPOOND
IGCC		$\rho$ - intra group visibility correlation coefficient, $0 \leq \rho \leq 1.0$
IMAGE		The start address of the buffer which contains the converted image of the last card read by CARDIO
INPUT	10	The buffer used to contain the data card images
IPVIS		Option flag for selection of probability of visibility used by TSPOOND IPVIS = 0 Intra/Inter group visibility correlation considered - probability of visibility from File 8  IPVIS = 1 Intra/Inter group visibility correlation considered - probability of visibility from target specific selection files of BIT  IPVIS = 2 Intra/Inter group visibility correlation considered - probability of visibility from function card  IPVIS = 3 Independent (no correlation) using probability of visibility from File 8

~~SECRET/D~~

~~SECRET/D~~

<u>JOVIAL Symbol</u>	<u>Dimension</u>	<u>Description and Units</u>
IPVIS (continued)		IPVIS = 4 Independent (no correlation) using probability of visibility from function card
IRN		Initial random number seed $0 \leq \text{IRN} \leq 2^{36}$
ITOPG		The selected target index referenced from the beginning of the group
ITOPT		The selected target index referenced from the beginning of the rev
IVO		Decision strategy flag for determining target selection. At present no options exist for this strategy
KBIT		TWONDER BIT tape logical symbolic unit
KIN		Symbolic unit assignment for input unit
KOL		Symbolic unit assignment for Monte Carlo specific detail and summary output
KON		On-line printer symbolic unit
KOUT		Symbolic unit assignment for listable secure output tape
KSPOUT		Symbolic unit assignment for TSPOND users interface tape
KSPTFG		Flag used to control KSPOUT output  KSPTFG $\neq$ 0 KSPOUT not written  KSPTFG = 0 Information in buffer to be output on KSPOUT
LINECNT		Line counter used in the formatted output of the Monte Carlo specific information (KOL Tape)
LPIL		Boolean flag used to check success of the last I/O operation
MAX		Item containing the maximum value of a particular summary output parameter on a rev by rev basis; used in extended statistics output logic

~~SECRET/D~~

~~SECRET/D~~

<u>JOVIAL Symbol</u>	<u>Dimension</u>	<u>Description and Units</u>
MCBUF		120 byte BCD output buffer; used primarily to buffer the Monte Carlo specific formatted output
MEAN		Item containing the mean value of a particular summary output parameter on a rev by rev basis; part of the extended statistics output
MIN		Minimum value of a particular summary output parameter
NALTN		Total number of alternate targets accumulated over a rev span
NCNFLT		Total number of groups eliminated due to conflict within a rev span
NCOM		Total number of rev span summaries to be processed by TSPOND
NGPRS		Total number of groups accumulated over a rev span
NPRIM		Total number of primary targets accumulated over a rev span
NS		Current sample number
NTPRS		Total number of photographed targets on the TWONDER BIT accumulated over the present rev span
NULLREV		Boolean flag used to indicate a null rev (no targets on a particular rev) occurring on the TWONDER BIT
NVIT		Total number of visual intelligence targets accumulated over a rev span
PFAL		Function card probability of false alarm (i.e., probability that a crew member reports a target active when it is inactive), $0. \leq PFAL \leq 1.0$
PFALM		TSPOND working cell for probability of false alarm, $0. \leq PFALM \leq 1.0$

~~SECRET/D~~

~~SECRET/D~~

<u>JOVIAL Symbol</u>	<u>Dimension</u>	<u>Description and Units</u>
PRCNTRL		Boolean flag to control printing of Monte Carlo specific output  PRCNTRL $\neq$ 0, No Monte Carlo specific output written  PRCNTRL = 0, Monte Carlo specific output written on KOL
PRCONFL		Conflict matrix of target selected in previous group
PREC		Probability of recognition, $0. \leq \text{PREC} \leq 1.0$
PRECOG		TSPOOND working cell for probability of recognition, $0. \leq \text{PRECOG} \leq 1.0$
PRIM		Flag indicating whether the group being processed contains a primary target  PRIM = 1 current group contains a primary target  PRIM = 0 current group does not contain a primary target
PRIMRY	5	Array containing the count of active, inactive, reject, unobserved, and total primary targets over a rev span
PROBA		Probability of activity off Reset File 8 of the TWONDER BIT, $0. \leq \text{PROBA} \leq 1.0$
PROBFA		Probability of false alarm off Reset File 8 of the TWONDER BIT, $0. \leq \text{PROBFA} \leq 1.0$
PROBREC		Probability of recognition off Reset File 8 of the TWONDER BIT, $0. \leq \text{PROBREC} \leq 1.0$
PROBV		Probability of visibility off Reset File 8 of the TWONDER BIT, $0. \leq \text{PROBV} \leq 1.0$

~~SECRET/D~~

~~SECRET/D~~

<u>JOVIAL Symbol</u>	<u>Dimension</u>	<u>Description and Units</u>
PROL		Function card input parameter controlling which output tapes will be written  PROL > 0 BCD interface tape (KSPOUT), and listable output tape (KOUT) will be written  PROL < 0 KSPOUT, KOUT, and Monte Carlo specific output tape (KOL) will be written
PV		Working cell for the probability of visibility, $0. \leq PV \leq 1.0$
PVINP		Probability of visibility input on TSPOOND function card, $0. \leq PVINP \leq 1.0$
PVIS		Working cell for the probability of visibility of the group being processed, $0. \leq PVIS \leq 1.0$
PVIS1		Working cell for the previous group's probability of visibility, $0. \leq PVIS1 \leq 1.0$
RA		Reported activity of current target RA = 0 reported not active = 1 reported active = 2 not reported
RATIO1	}	Dwell time density ratios for clear votes. The recommended dwell time is multiplied by each of these ratios to form the vertices of the dwell time triangular density function for clear votes
RATIO2		
REVTAB		Name of table containing the selection file parameters (one rev's worth)
REN		Rev number of ending rev of the current rev span
RN		Current rev number

~~SECRET/D~~

~~SECRET/D~~

<u>JOVIAL Symbol</u>	<u>Dimension</u>	<u>Description and Units</u>
RR1 } RR2 }		Dwell time density ratios for reject votes. $X_1, X_2, X_3$ represent (in sec.) the three vertices of the dwell time triangular density function for reject votes  $RR1 = \frac{X_1}{X_2}$  $RR2 = \frac{X_3}{X_2}$
RV		Reported visibility of current target RV = 0 reported not visible RV = 1 reported visible RV = 2 not reported
SCOF	2	Scope on flags, set to non zero for each scope after first viewing by each scope, initialize once for each group
SIGMA	30	Array containing the standard deviations of the 30 output parameters when extended statistics are desired
SIGT	2	Current time for scope SN (sec)
SMAX	30	Array containing the maximum of the 30 output parameters when extended statistics are desired
SMIN	30	Array containing the minimum of the 30 output parameters when extended statistics are desired
SN		Number of scope viewing current target
SNN		Index of scope number viewing current target $SNN = SN - 1$
STAT	30	Array containing running sums of the 30 output parameters of the extended statistics output over one sample
STATS	30	Array containing sums of the 30 output parameters of the extended statistics output over all samples

~~SECRET/D~~

~~SECRET/D~~

<u>JOVIAL Symbol</u>	<u>Dimension</u>	<u>Description and Units</u>
STOF		Scope off time for viewing of current target (sec)
STON		Scope on time for viewing of current target (sec)
TALT*		Target altitude (ft X 10 <sup>-2</sup> )
TAON*		ATS on time, seconds, machine time
TASSNO*		Scope number used 0 - not viewed by ATS (target specific) 1 - scope 1 used 2 - scope 2 used
TATSMO2*		Off time for MO photography of alternate targets, seconds, machine time
TAWGT*		ATS relative target weight (non-dimensional)
TBAB13*		Time between forward and vertical acquisition (sec)
TBACD*		Specifies alter option used 0 - none 1 - add 2 - change 3 - delete
TBAHT*		Vehicle altitude at time of vertical acquisition (nautical miles)
TBAMS*		Mission number
TBAPR*		Probability factor (%)
TBARV*		Revolution of acquisition requested on target card
TBASA*		Sun elevation angle (rad)
TBASR*		Slant range at time of vertical acquisition (naut. mi.)

\*Indicates items are passed from the selection files of the TWONDER BIT input tape.

~~SECRET/D~~

~~SECRET/D~~

<u>JOVIAL Symbol</u>	<u>Dimension</u>	<u>Description and Units</u>
TBAVY*		Azimuth flag 0 - descending 1 - ascending
TBA16*		Obliquity of vertical acquisition
TBA23*		Obliquity deletion angle (deg). A limit for obliquity beyond which targets are deleted from consideration
TBENCHF*		Flag indicating target is a bench mark target (1 - yes, 0 - no)
TDDD*		Target diameter (ft X 10)
TDECIS*		Latest time at which decision can be made to take primary target of a group or substitute an alternate (sec)
TDWELL*		Nominal ATS dwell time (sec)
TEEE*		Sun deviation angle at time TT2 (radians)
TFLECT*		Conflict matrix (or word). 24-bit array in which a bit is set to 1 for each photographable target in the following group which the target conflicts with
TFSUM		Flags indicating rev span summary desired or not 0 - Summary desired for corresponding rev span 1 - Rev span summary not desired for corresponding rev span
TGRNO*		Target group number
TIDA*		First 8 characters of target's alpha numeric identifier
TIDB*		Final 2 characters of target's alpha numeric identifier
TIDX		Target index within current rev 0 - 1st target 1 - 2nd target, etc.

\*Indicates items are passed from the selection files of the TWONDER BIT input tape.

~~SECRET/D~~

~~SECRET/D~~

<u>JOVIAL Symbol</u>	<u>Dimension</u>	<u>Description and Units</u>
TLAT*		Target latitude (radians)
TLONG*		Target longitude (radians)
TMATSF*		Mandatory ATS flag, indicates target must be viewed with ATS (1 - yes, 0 - no)
TMAX		The maximum time within which inter-group visibility correlation is considered (sec)
TMODE*		Requested photographic mode (0-9)
TMPF*		Mandatory primary flag. If set, target is to be taken by main optics and is assigned a priority of 0. (1 - yes, 0 - no)
TMSIG*		Mid stereo angle (deg), the stereo angle at the average time between TT1 and TT3
TN		Target number within group (1 to TNMAX)
TNASSTE*		Number of ATS entries for rev
TNBITE*		Number of entries on BIT for entire rev
TNMAX	100	Maximum number of targets within each group of current rev
TNMOSTE*		Number of main optics entries on BIT for entire rev
TNN		Target index within current group 0 - 1st target in group 1 - 2nd target in group, etc.
TNP	2	Rev specific target numbers of the last target within current group taken by current scope
TNSF*		Direction of vehicle pass over target 0 - North to South 1 - South to North

\*Indicates items are passed from the selection files of the TWONDER BIT input tape.

~~SECRET/D~~

~~SECRET/D~~

<u>JOVIAL Symbol</u>	<u>Dimension</u>	<u>Description and Units</u>
TOMEGA1*		Obliquity at time TT1 (radians)
TOMEGA2*		Obliquity at time TT2 (radians)
TOMEGA3*		Obliquity at time TT3 (radians)
TONS		Total number of samples requested on current rev span summary
TONSN	100, 2	Array containing ATS time on (both scopes) for each group within rev (sec)
TPRIA*		Active priority of target (0-99)
TPRII*		Inactive priority of target (0-99)
TPROBA*		Probability of activity for a given target (%)
TREN		Ending rev number of the current requested rev span
TREV*		Rev number incremented at passage of ascending node
TRR*		Resolution requirement in inches (0-99)
TRST		Beginning rev number of the current requested rev span
TSC*		Scan target flag, (1 - yes, 0 - no)
TSCC*		Special category code, designating a target which falls in a special category (000-999)
TSHAPE*		Pitch weighting function (0-9) (See File 8 Description, TWONDER User's Manual, Reference 3)
TSIGMAD*		Desired pitch angle (deg)

\*Indicates items are passed from the selection files of the TWONDER BIT input tape.

~~SECRET/D~~

~~SECRET/D~~

<u>JOVIAL Symbol</u>	<u>Dimension</u>	<u>Description and Units</u>
TSMODE*		Main optics selected photographic mode (0-9) (See File 8 Description, TWONDER User's Manual, Reference 3)
TTDWELL*		ATS dwell time from File 8 (sec)
TTIME*		Time of vertical acquisition (when vehicle is closest to target) in minutes from base date
TTLV*		Target location validity code (0-9)
TTOFF*		Main optics off time in seconds, machine time
TTON*		Main optics on time in seconds, machine time
TTONS		Array containing total number of samples for each requested rev span
TT1*		Forward acquisition time (machine time sec)
TT2*		Vertical acquisition time (machine time sec)
TT3*		Aft acquisition time (machine time sec)
TVAP*		Target type flag 0 - VIT 1 - Primary 2 - Alternate
TVELI*		Inertial velocity vector magnitude of vehicle at time of vertical acquisition (ft/sec)
TVIF*		VIT flag, designates target to be viewed by ATS only, non-photographable (1 - yes, 0 - no)
TWA*		Active target weight, non-dimensional
TWEIGHT*		Main optics relative weight of selected target, a measure of target worth, non-dimensional

\*Indicates items are passed from the selection files of the TWONDER BIT input tape.

~~SECRET/D~~

~~SECRET/D~~

<u>JOVIAL Symbol</u>	<u>Dimension</u>	<u>Description and Units</u>
TWI*		Inactive target weight, non-dimensional
TWX*		Weather factor (0-99)

### 3.2 TSPOOND

#### 3.2.1 Purpose

TSPOOND serves as the highest level control routine for the Statistical Program of On Board Decisions (TSPOOND). Its primary function is to initialize core storage properly; in addition, it contains the main body of program item, array and table data declarations. TSPOOND performs no computations but merely passes execution control to the next TSPOOND sub-module to accomplish the TSPOOND task.

#### 3.2.2 Usage

##### 3.2.2.1 Calling Sequence

TSPOOND is the main routine in the TSPOOND computer program and is initiated by input of the TSPOOND function card to the SMTC executive control program.

##### 3.2.2.2 Input

CLANK	Cell containing the current location counter; i.e., the first available memory location
KOUT	Symbolic listable output tape (logical tape 8)

##### 3.2.2.3 Output

None

##### 3.2.2.4 Error/Action Messages

None

##### 3.2.2.5 Subroutines Called

### 3.3 SUBROUTINE BERN

#### 3.3.1 Purpose

BERN is a Bernoulli random number generator which will output either a zero or a one as a function of a random number obtained from RDM1J. If the random number from RDM1J is less than or equal to a specified probability, BERN will output the number one. If the random number from RDM1J is greater, BERN will output zero.

### 3.4 SUBROUTINE BITRE

#### 3.4.1 Purpose

The function of subroutine BITRE is to read into core storage the MO and ATS selection file(s) of the TWONDER BIT, one file (rev) at a time corresponding to the current rev being processed. Secondary functions of BITRE are to calculate the total number of groups within a rev and the number of targets within each group, to set up the voting table weights corresponding to each target, and to tabulate the scope on-times for the scopes in each group.

NTPG	Target counter
NTR	Total number of targets on current rev
NTT	Total number of targets on current rev left to be processed
PA	Probability of activity

3.4.2.5 Error/Action Messages

In searching the TWONDER BIT for the current rev, if an end-of-tape is encountered before the rev is found, the following error message appears on-line and execution is halted:

"REV XX NOT FOUND ON BIT"

This message indicates that the current rev selection file cannot be located on the TWONDER BIT. Either a new BIT should be mounted and the TSPOOND run restarted, or the GO button should be depressed to continue program processing on the next requested rev.

~~SECRET/D~~

~~SECRET/D~~

3.4.2.6 Subroutines Called

READ	Binary read routine
CHECKR	Checks last read operation
OCTBCD	Octal to BCD conversion routine
SKIPF	Spaces a magnetic tape a number of files
SPACEUP	Spaces on-line printer up 16 lines for readability
PRINTOUT	Generalized BCD output routine
TAPERR4	Read error action routine

3.4.2.7 Called By Following Routines

PROREV	Rev processing driver
--------	-----------------------

3.4.3 Method

BITRE reads a file (or one rev of information) from the TWONDER BIT into the rev table (REVTAB) buffer storage. By comparing group numbers of each target, the number of groups within the rev as well as the number of targets within each group is calculated. Next, the voting table weights (active, inactive, reject, unobserved weights) are computed and stored for each target. The active (TWA) and inactive (TWI) weights are extracted directly from the rev table, with the unobserved weight,  $W_{unob}$  computed as follows:

$$W_{unob} = P_V [P_A (TWA) + (1-P_A) TWI]$$

where  $P_V$  = probability of visibility

$P_A$  = probability of activity

The reject weights are set to zero. An array of indexes, VDICT, are logged which serve as pointers to each group's position in the voting table of weights. The individual scope on-times for each group are extracted directly from the rev table and stored at this time for future reference.

~~SECRET/D~~

~~SECRET/D~~

3.4.4 Restrictions

BITRE can only process tapes written in the TWONDER BIT format (Reference 2). The tapes must be spaced to the selection file(s) and the revs must be processed in ascending order; i.e., BITRE does not search backwards on the BIT for a specified rev.

### 3.5 SUBROUTINE BUFSET

#### 3.5.1 Purpose

BUFSET is used to transfer values from an input buffer to fixed locations within an output buffer (BUFOUT) and to convert those values from a binary floating point to a BCD floating point format. The result of printing this output buffer will be a listing that displays the output, five BCD words per line.

#### 3.5.2 Usage

3.5.2.7 Called By

PROBIT

3.5.3 Method

BUFSET transfers five words at a time from the input array to the output buffer, constituting one record of information. The five words of each record are arranged in the following characters of the record:

Word 1 - Characters 15 to 30  
Word 2 - Characters 35 to 50  
Word 3 - Characters 55 to 70  
Word 4 - Characters 75 to 90  
Word 5 - Characters 95 to 110

~~SECRET/D~~

### 3.6 SUBROUTINE CCP

#### 3.6.1 Purpose

The purpose of subroutine CCP is to read and process all command cards, (SUMMARY, DETAIL, EXTENDED data cards), set up the command table sorted by rev number, and determine which revs require output of typical detail statistics and rev span summary statistics. Based upon EXTENDED card input, CCP also determines those rev span summary output parameters for which extended statistics are to be computed.

#### 3.6.2 Usage

##### 3.6.2.1 Calling Sequence

CCP \$

##### 3.6.2.2 Input

~~SECRET/D~~

b. Outputs via common locations

DBITS  
EXTBITS  
NCOM  
TFSUM  
TREN  
TRST  
TTONS

3.6.2.4 Working Storage Within Routine

<u>Name</u>	<u>Description</u>
BITNO	Contains bit number extracted from a word
DWDS	Number of words read by last read operation
INSPAN	Current rev number within the rev span during input processing phase
NCOMTB	Counter on number of entries in the command table
OUTPUT	Array containing the command card items converted from a free field format
SORTAB	Starting address of the table to be sorted

3.6.2.5 Error/Action Messages

When CCP encounters a command data card with an incorrect format, the following message appears on-line:

SYSTEM DETECTED ERROR ON LAST CARD READ, INSERT CARD AND TRY AGAIN

To continue program execution, the data card should be corrected and re-input.

If the input data deck does not contain any SUMMARY or DETAIL command cards, the following message appears on-line and program execution is aborted:

NO SUMMARY OR DETAIL CARDS PROCESSED, PROGRAM CANNOT CONTINUE

~~SECRET/D~~

~~SECRET/D~~

If either a SUMMARY or a DETAIL data card shows a requested rev number greater than rev 720, the following message appears on-line:

REV NUMBER GREATER THAN 720, INSERT CARD AND TRY AGAIN

Program execution may be continued after the data card is corrected and re-input.

### 3.6.2.6 Subroutines Called

CHECKN	}	JOVIAL I/O procedures
CHECKW		
CREAD		
CWRITE		
FFCONV		Free field conversion routine
SORT		Sorts tables with parallel entries in ascending or descending order.
SPACEUP		Spaces on-line printer up 16 lines for readability

### 3.6.2.7 Called By Following Routines

MCDRIV

### 3.6.3 Method

CCP performs no computations and is primarily concerned with processing command card input information. These command cards (SUMMARY, DETAIL, EXTENDED cards) are read one card at a time and the rev span information thereon is placed in a contiguous table in core storage. In the case of DETAIL and EXTENDED card information, corresponding bits of the DETAIL and EXTENDED arrays are set to indicate (1) those revs where typical sample detail output is requested, and (2) those rev span summary output parameters for which extended statistics have been requested, respectively. After all command data cards have been read and processed, the rev span command table is then sorted by rev number to facilitate the rev by rev TSPOOND processing.

~~SECRET/D~~

~~SECRET/D~~

#### 3.6.4 Restrictions

3.6.4.1 When both SUMMARY and DETAIL command cards are present in the data deck, CCP expects all the SUMMARY data cards to precede the DETAIL cards, although the SUMMARY cards as well as the DETAIL cards may appear in any order within themselves.

3.6.4.2 There must exist at least one SUMMARY or one DETAIL card in the data card deck setup. SUMMARY cards only or DETAIL cards only are acceptable data decks.

3.6.4.3 One DETAIL or EXTENDED command data card may contain at most 25 items. The inclusive "TO" descriptor should be used to meet this limitation if necessary (See Reference 1, section 2.3, Data Card Input).

GETV

3.7.3 Method

The intra-group weather correlation model (see Section 2.5) assumes that the correlation between any two targets within a group is the same, with the amount of correlation given as input. The probabilities of visibility  $P_c$  and  $P_1$  are determined in CORV and the

~~SECRET/D~~

~~SECRET/D~~

visibility of each target in the group is simulated as a function of these probabilities by a succession of calls to a Bernoulli random number generator. The computational equations for generating the probabilities  $P_c$  and  $P_l$  are shown as follows:

$$K' = \frac{\bar{p} \bar{p} (1-\bar{p})}{(2\bar{p} - 1)^2}$$

$$P_c = \frac{1}{2} \left( 1 + \frac{1}{\sqrt{4K' + 1}} \right)$$

$$P_l = \frac{1}{2} + \left( \bar{p} - \frac{1}{2} \right) \sqrt{4K' + 1}$$

### 3.8 SUBROUTINE DECIDE

#### 3.8.1 Purpose

Subroutine DECIDE determines the "winning" target of a group (target within the group chosen for photography) according to the following decision strategy:

- Simulate the vote (active, inactive, reject or unobserved) for each target in the group
- Determine the magnitudes of the corresponding vote weights for each target in the group (vote weight refers to that weight associated with an active, inactive, reject, or unobserved vote)
- Compare the magnitudes of all the vote weights and select that target corresponding to the largest vote weight as the "winner"

In addition to applying the above decision strategy, DECIDE records the weights with and without interdiction, and the number of clear targets with and without interdiction, for the rev span summary output.

### 3.8.2.5 Error/Action Messages

IVO, a function card input parameter (see Reference 1), dictates the decision strategy to be applied for the selection of a "winning" target within a group. At the present time, only one strategy exists in TSPOOND. If IVO is input non-zero (indicative of an alternate decision strategy desired) the following error message is displayed on-line, and execution continues utilizing the selection strategy of DECIDE:

"NO OTHER DECISION STRATEGY FOR IVO NQ 0"

### 3.8.2.6 Subroutines Called

CWRITE                    System BCD output routines  
CHECKW

### 3.8.2.7 Called by Following Routines

PROGRO                    Target group processor

### 3.8.3 Method

The decision algorithm, as explained in Section 3.8.1, is accomplished in DECIDE using the predetermined votes and corresponding vote weights of each target in the group. The active vote weights,  $W_A$ , and inactive vote weights,  $W_I$ , are extracted directly from the TWONDER rev table with the reject vote weights always stored as zeros. DECIDE computes the target specific unobserved vote weights,  $W_U$ , as follows:

$$W_U = P_V [P_A W_A + (1-P_A) W_I]$$

where  $P_V$  is the probability of visibility and  $P_A$  is the probability of activity.

Figure 3-7 shows the computational flow of subroutine DECIDE.

GETV

3.17.3 Method

The inter-group weather correlation model (see Section 2.6) assumes that visibility for the present group of targets is dependent only upon the visibility of the previous group of targets. The amount of correlation is a function of both the time interval between their group decision times and the time,  $t_{\max}$ , at which the inter-group correlation coefficient becomes 0. INTER computes the probability of visibility as a function of the weather correlation coefficient for every sample of each group (except the first group of the rev).

$$\beta = \sqrt{\frac{P_V^{(1)}(1-P_V^{(2)})}{P_V^{(2)}(1-P_V^{(1)})}}$$

where  $P_V^{(1)}$  is the probability of visibility of the previous group's first target, and  $P_V^{(2)}$  is the probability of visibility of the current group's first target. The maximum value of correlation between both groups is

$$\rho_{\max} = \min \left\{ \beta, \frac{1}{\beta} \right\}$$

The correlation coefficient is then computed as

$$\rho^* = \left( \frac{t_{\max} - \Delta T}{t_{\max}} \right) \rho_{\max}$$

~~SECRET/D~~

~~SECRET/D~~

where  $\Delta T$  is the time interval between group decision times. A quantity  $Q$  is computed,

$$Q = \rho * \sqrt{P_V^{(1)}(1-P_V^{(1)}) P_V^{(2)}(1-P_V^{(2)})}$$

If the first target in the previous group was not visible, the probability of visibility,  $P_V^{(2)}$  becomes

$$P_V^{\prime(2)} = P_V^{(2)} - \left( \frac{0}{1-P_V^{(1)}} \right)$$

and in the case where the previous group's first target is visible

$$P_V^{\prime(2)} = P_V^{(2)} + \left( \frac{0}{P_V^{(1)}} \right) .$$

The functional flow diagram of INTER is shown as Figure 3-13.

### 3.18 SUBROUTINE MCDRIV

#### 3.18.1 Purpose

MCDRIV is the main driver for the logic associated with the execution of a given TSPOOND run. Its main function is to control the order of execution necessary to accomplish the following subfunctions of TSPOOND:

- Initialization of logical tape units and other buffer storage areas.
- Processing of function card and command data card input information.
- Processing and transfer to KSPOUT of all TSPOOND pertinent information from first two files of the TWONDER BIT:
  - a) ID records
  - b) Ephemeris information
  - c) Reset files 7 and 8.
- Control logic associated with processing of rev span summaries and typical sample detail output requests on a single rev or rev span basis.
- Computation of extended statistics on requested rev span summary output parameters.

TSPOOND (main program)

~~SECRET/D~~

~~SECRET/D~~

### 3.18.3 Method

MCDRIV is primarily concerned with sequencing and controlling the subroutines for a TSPOOND run. Figure 3-14 is a flow chart which illustrates the execution order of MCDRIV. As shown on the flow diagram, the number of samples are completed on a rev by rev basis rather than on a rev-span by rev-span basis. This was necessitated by core size limitations which allowed only a rev's worth of data to reside in core at any one time.

RECOVERY PROCEDURE

An end of file was encountered on the first read operation of the BIT. Remount the proper tape and push GO.

The requested rev span on the input data cards is outside the rev span range available on the BIT. Either the wrong BIT has been mounted or the data cards are incorrect. Correct and restart.

The word TWONDER was not found on the function card while searching the image of the third record of the first file of the BIT. Push GO to ignore.

The vehicle number was not found on the TWONDER function card image (third record of the first file of the BIT). Push GO to continue.

While searching the image of the third record of the first file of the BIT, no blanks were found following the vehicle number. No vehicle number match up can be performed. Push GO to continue.

The vehicle numbers on the TSPOND and the TWONDER function cards do not match. If the correct BIT is mounted push GO to continue. Otherwise mount the proper BIT and restart.

MCDRIV

3.20.3 Method

PROBIT reads the first two files of the BIT input tape record by record. As each record is read, the information thereon is converted to BCD and written onto the magnetic tapes KSPOUT, KOUT, and KOL. The rev span of the BIT is compared to the rev span on the input data cards to determine compatibility between TWONDER and TSPONND. The vehicle number on the BIT is compared to the one on the TSPONND input function card as another compatibility check.

Four cells of core are loaded from the File 8 data on the BIT. These are PROBA (probability of activity), PROBFA (probability of false alarm), PROBREC (probability of recognition), and PROBV (probability that target is visible). PROBIT sets PV (probability of visibility) equal to PROBV from File 8 if the input parameter flag IPVIS is zero or three; otherwise it sets PV equal to the input parameter PVINP.

PROBIT returns to MCDRIV with the BIT input tape positioned at the beginning of the third file.

Figure 3-16 shows the flow logic for PROBIT.

GETV	Computes probability of visibility and determines target visibility considering both inter-group (between groups) as well as intra-group (within a group) visibility correlation
GETDT	Computes scope slew and settle times along with actual scope dwell time
VOTE	Simulates the reported and actual states of target visibility and activity

3.23.2.7 Called By Following Routine

PROGRO

3.23.3 Method

PROTAR is entered once per target and follows the order of computation indicated below:

1. Subroutine GETV computes the probability of visibility as a function of the input parameter, IPVIS. IPVIS also dictates whether intra-group visibility correlation should be considered or not. The inter-group visibility correlation model (Section 2.6) is always simulated.
2. Simulates target visibility within a group by generating, at random, a visibility flag corresponding to each target indicating either visibility or non-visibility.
3. Calculates dwell time and scope time on and off for each target using the recommended slew and settle time from the TWONDER selection files. (Subroutine GETDT).
4. Processes voting logic and determines the reported and actual states of visibility and activity (Subroutine VOTE).

PROBIT

3.25.3 Method

Reset Files 7 and 8 parameters, as contained on the TWONDER BIT, are converted from binary to BCD for TSPOOND output display. Two types of conversions are necessitated, floating point and integer. SETF78 indicates those parameters within Files 7 and 8 requiring integer BCD conversion. This is effected by setting those bits in the array F78IT, corresponding to the locations of the integer words within Files 7 and 8, to non-zero. Subsequent interrogation of the bits of array F78IT will identify those parameters requiring integer BCD conversion for output.

3.28.3 Method

SPANØUT takes the rev span summary output parameters which have been accumulated over both the current rev span of interest and the requested range of samples, and computes averages of these parameters. An approximation to the mean of each of these output parameters, then, is displayed on output tapes KØL, KØUT. A complete description of the rev span output parameters along with a sample of the output is given in Section 3.2.3 of Reference 1.

### 3.29 SUBROUTINE SPECOL

#### 3.29.1 Purpose

SPECOL sets up the output buffer (MCBUF) and writes the page headers and column headers for each page of the special Monte Carlo output. If a new page of output is not being initiated, SPECOL writes only the first two columns (group number and target selected within the group) of the group specific Monte Carlo output.

##### 3.30.2.4 Working Symbols

<u>Program Symbol</u>	<u>Description</u>
ENDTP	Hollerith descriptor of error message

~~SECRET/D~~

~~SECRET/D~~

### 3.30.2.5 Error/Action Messages

The following message is displayed when the physical end of tape is encountered:

"MOUNT NEW TAPE ØN UNIT XX HIT GO"

Section 3.30.3 indicates the desired operator action when this occurs.

### 3.30.2.6 Subroutine Called

SPACEUP	Spaces on-line printer for readability
OUTPUT	System output routine

### 3.30.2.7 Called By

PRINTØUT

### 3.30.3 Method

When the physical end of tape is encountered, program execution halts after the error message has been displayed on-line. At this point, the TSPOND user or machine operator should mount a new tape reel on the designated tape drive and depress the "GO" button to continue program execution. The program will proceed to rewrite the record which caused the halt and resume execution as normal.

See Figure 3-24 for the flow logic.

~~SECRET/D~~

### 3.31 SUBROUTINE TAPERR4

#### 3.31.1 Purpose

TAPERR4 is used to write an error message on the printer when a system error in reading a tape is detected. When this occurs, program execution halts awaiting the operator action requested by the error message.

#### 3.31.2 Usage

##### 3.31.2.1 Calling Sequence

TAPERR4 (TAP4NO = TRY4.) \$

##### 3.31.2.2 Input

###### a. Calling sequence

<u>Program Symbol</u>	<u>Description</u>
TAP4NO	The tape unit being read from
TRY4	The return address from the calling program to which execution returns

###### b. Inputs through common locations

SPACEUP  
OUTPUT  
OUTERR  
SKIPR

#### 3.31.2.7 Called By

BITRE  
PROBIT

#### 3.31.3 Method

After the error/action message is displayed on-line, program execution terminates awaiting the operator action requested by the message. If the operator elects to attempt the read instruction again, the console START button should be depressed. TAPERR4, at this point, returns execution control back to the previously executed read instructions for another attempt.

Figure 3-25 shows the TAPERR4 flow logic.

3.32.2.6 Subroutines Called

RDMLJ                      Uniform random number generator  
SQRT                        System square root

3.32.2.7 Called By

GETDT

3.32.3 Method

The altitude of the triangular density function is given by

$$h = \frac{2}{(R_2 - R_1)Q}$$

A random number, U, between zero and one is obtained from the random number generator, RDMLJ and is compared with

$$\frac{1-R_1}{R_2-R_1}$$

The dwell time, X, is determined conditionally so that

$$X = R_2Q - \sqrt{\frac{2Q(1-U)(R_2-1)}{h}}$$

$$\text{for } U > \frac{1-R_1}{R_2-R_1}$$

~~SECRET/D~~

~~SECRET/D~~

or

$$X = R_1 Q + \sqrt{\frac{2 QU(1-R_1)}{h}}$$

for

$$U \leq \frac{1 - R_1}{R_2 - R_1}$$

3.33.2.5 Error/Action Messages

None

3.33.2.6 Subroutines Called

BERN            Bernoulli random number generator

3.33.2.7 Called by Following Routine

PROTAR

3.33.3 Method

VOTE is entered once per target and the reported and actual states of target visibility and activity are used by the decision strategy for the selection of the "winning" target for photography within a group. The reported visibility, RV, actual visibility, AV, reported activity, RA, and actual activity, AA, are simulated by random sampling and the false alarm and failure to recognize states are recorded and summed as they are encountered.

Figure 3-27 shows the detailed VOTE flow diagram.
