MEMORANDUM FOR: Director of Central Intelligence
SUBJECT: Possible New Cartographic Program
REFERENCE: Letter from DNRO dated 13 October 1965
[REDACTED]

1. The attached memorandum on cartographic satellites is partially responsive to our inquiry. Rather than go another round of correspondence, I called Al Flax, who indicated that he would be quite happy to fill us in on the specifics of the programs he now has under way. I pointed out that we were more concerned with the substance of his efforts, although we were of course glad to know the extent of the commitments made by McMillan. [REDACTED] is to get in touch with us and offer us a briefing on the entire subject.

2. I recommend that you not take the time to follow this unless you have a free moment at the right time.

Albert D. Wheelon

Remarks:

DCI has not seen the attached letter from Flax. Does Flax's letter clarify the issue raised in the DCI's letter of 29 September? If not, please prepare a response for DCI signature.

Copies have been sent to DD/I and NIPE.

DEPARTMENT OF THE AIR FORCE
WASHINGTON

OFFICE OF THE ASSISTANT SECRETARY

18 OCT 1965

Dear Red:

Reference your letter to Dr. McMillan of 29 September 1965, with regard to mapping, charting, and geodesy.

As you know, the present satellite cartographic and geodetic collection capability has evolved over the last few years primarily in response to the needs expressed by the Department of Defense. These needs were met through the ARGON program, and as a secondary mission on other National Reconnaissance Program satellites.

The recent establishment of the Mapping and Charting Working Group of COMOR has provided the means for formalizing a national statement of requirements which includes those expressed by the Services and the Department of Defense. The DIA recently completed a study of the "Research and Development Requirements for Satellite Image Forming Acquisition Systems for Mapping, Charting, and Geodesy." This thorough analysis included the NRO collection capabilities and DIA correlation of these capabilities with the requirements. A summary of the map or chart accuracies desired is attached. Additional DOD coordination is being accomplished prior to forwarding this requirement formally to USIB/COMOR.

There is an apparent misunderstanding of the effort presently underway within the NRP toward an improved mapping, charting, and geodetic capability. A modest continuing effort is underway in three areas. A summary of the present activities in these areas is as follows:

(a) A feasibility study of a satellite with improved mapping, charting, and geodetic capability is scheduled to be completed in March 1966. This study considers the effect of possible future requirements and the lens effort described below.

[REDACTED]

(b) Study and design of wide-angle, high-resolution lenses, capable of acquiring the necessary geodetic data and providing the high fidelity detail necessary for accurate maps and charts. This effort together with the feasibility studies in (a) above involves some [redacted] and is presently planned to continue to early 1967.

(c) Two tasks are underway to improve knowledge of the precise position of the satellite in orbit. The first will result in a more accurate computer program to determine best fit ephemerides. The second involves consideration of a radar altimeter for more accurate determination of altitude. This effort involves some [redacted] and will be completed in mid-1966.

Any decision to initiate a new cartographic program must consider future statements of requirements as well as the performance demonstrated by the panoramic reseau and the three-inch index camera both programmed for flight in mid-1966.

Sincerely,

ALEXANDER H. FLAX
Director
National Reconnaissance Office
