MEMORANDUM TO: [REDACTED]
FROM : [REDACTED]
SUBJECT : VISUAL EDGE MATCH MISSION 1112-1

The Vem analysis and the Mobil Corn resolution determinations were started early Sunday morning as soon as the domestic original negatives of Revs 16 and 48 were made available. The original intent was to read edges in both the IMC and scan direction, as close to center or format as possible, on six frames of both the prime and the alternate filters for both Revs on the Aft Camera only. This intent was modified slightly for Rev 48, because of time constraints placed on the original negatives, to only reading three frames on each filter. The following listing represents the average resolution for three readers (myself, [REDACTED] in the scan and IMC directions. Note: The frames selected for the Vem analysis were based on the following commanded schedual for prime/alternate and transition frames.

REV 16

FWD CAMERA

Frames 1-7 Prime
8-9 Transition
10-23 Alternate]

AFT CAMERA

Frames 1-13 Prime
14-15 Transition
16-23 Alternate

REV 48

FWD CAMERA

Frames 1-8 Prime
9-10 Transition
11-14 Alternate

AFT CAMERA

Frames 1-14 Prime
15-16 Transition
17 Alternate

VEM RESOLUTION
REV 16 - AFT CAMERA

<u>PRIME FILTER</u>				<u>ALTERNATE FILTER</u>			
Frame	8	SCAN	102 L/MM	Frame	16	SCAN	136 L/MM
		IMC	110			IMC	144
	9	SCAN	113		17	SCAN	127
		IMC	122			IMC	152
	10	SCAN	120		18	SCAN	115
		IMC	113			IMC	112
	11	SCAN	118		19	SCAN	114
		IMC	107			IMC	114
	12	SCAN	133		20	SCAN	112
		IMC	152+			IMC	99
	13	SCAN	152		21	SCAN	97
		IMC	140			IMC	122

REV 48 - AFT CAMERA

<u>PRIME FILTER</u>				<u>ALTERNATE FILTER</u>			
Frame	10	SCAN	152 L/MM	Frame	19	SCAN	122 L/MM
		IMC	140			IMC	81
	11	SCAN	152		20	SCAN	102
		IMC	110			IMC	86
	12	SCAN	135		21	SCAN	86
		IMC	146			IMC	120

Plots of these resolution numbers are attached for both Revs. The Rev 16 plot indicates that in general the average resolution level of the prime and the alternate filters are similar, which was in fact observed during the subjective analysis of the same material. The reason for the abrupt change in apparent edge quality between frame 11 and 12 and frames 17 and 18 is not clear at this time unless it is associated in some way with the filter transition. The plot for Rev 48 clearly indicates the better performance produced by the prime filter, and does not indicate a similar increase in edge quality prior to and following the filter transition phase.

During the period that the Vem analysis was being performed on the Aft Camera, we also read the Mobil Corn targets from original negatives on the forward camera. Immediately following completion of the Vem analysis we did the same on the Aft Camera.

The following resolution numbers represents an average of four readers.

MOBIL CORN RESOLUTION READINGS

FWD CAMERA REV 16

Target Location	Frame	Altitude	Slit Width	Exp. Time	Fil. P/Alt.	Vernier Scan-IMC	51-51 Scan-IMC
Lucerne, Cal.	6	623,140'	0.189"	347	Prime	7.5'-7.5'	7'-5.6'
Aguanga, Cal.	12	621,486'	0.189"	347	Alt.	7'-7.5'	8'-8'

REV 48

Safford, Ariz.	6	611,410'	0.154"	441	Prime	7'-7'	5.6'-7.1'
Doug.-Bisbee Intl. Airport, Ariz	15	610,047'	0.154"	441	Alt.	N/A	6.3'-8'

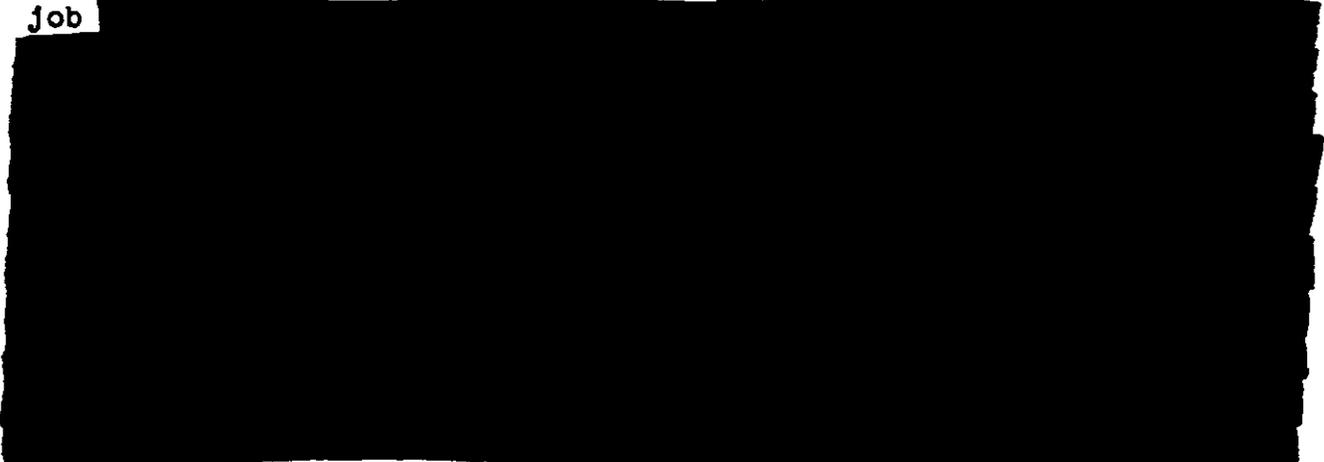

AFT CAMERA REV 16

Lucerne, Cal.	12	621,506'	0.160"	419	Prime	7'-7'	6.3'-6.3'
Aguanga, Cal.	18	619,862'	0.160"	419	Alt.	7'-8.5'	6.3'-7.1'

REV 48

Safford, Ar.	21	609,216'	0.125"	542	Prime	7'-7'	7.1-7.1'
Doug.-Bisbee Int. Airport, Ariz.	12	610,512'	0.125"	542	Alt.	N/A	12'-12'

I think that in general, the Vem exercise went somewhat faster this time than last. That is, we produced more data in a shorter time period, of course, we only had three readers this time instead of four, but in any respect, it is a very tiring job
