## TOP SECRET

The Near Real Time Photo-Reconnaissance Program (EOI-FROG)

# Report by the National Reconnaissance Panel to the

President's Science Adviser
July 14, 1971

At your request we have reviewed the Near Real Time photoreconnaissance program, both EOI and FROG. The Panel meeting of June 11, 1971 was supplemented by further discussions and visits. We have judged the expected performance and relative program risk of EOI and FROG, as follows:

	$\_$ 1. EOI will have a best nadir GS	D (ground sample distance)
o <b>f</b>	in a 188 by 383 n mi orbit, with a	mission duration.
FRO	OG will have a best nadir GRD (grou	nd resolution distance) of 24"
iron	n 170 miles altitude, but it can prob	ably be operated at 85 miles
altit	tude for 15-30 days of its nominal 9	month mission, from which
altit	tude it will have a 12" GRD.	

A substantial experiment performed by NPIC has compared 3 examples of best actual G imagery with simulated EOI imagery

EOI will have many more accesses at GSD below

2. Near nadir, the FROG

On the other hand, FROG will require the development or adaptation of many techniques and pieces of equipment new to the

program and to the contractors:

- a. Bimat processing with 1 yr. life, involving thermal control to 1°C accuracy at 0°C.
  - b. Laser scanner-film guide
  - c. Roll joint modifications
  - d. Zero-g propellant requirement
  - e. Flexible solar cell array
- 'f. In general, the many systems responsible for raising the number of "relay-driver pairs" from 220 in the G system to 760 in the proposed FROG.

According to an Air Force spokesman, "every AGENA subsystem is new," as is the film-electronics module. These capabilities appear possible of achievement, no inventions appear to be required, but our experience with analogous development programs (both in this field and in the contexts in which we individually have experience) causes us to regard the successful achievement of all these capabilities on schedule as a substantial risk.

We conclude that the risk associated with FROG on the stated schedule may well be greater than that associated with EOI on its schedule with operational capability one year later.

5. At 17° N latitude, the edge of swath resolution is:

EOI - 26" GSD (ground sample distance, geometric mean) FROG - 84" GRD (ground resolution distance, geometric mean)

Scaling from the experiment performed by NPIC comparing the best of G<sup>3</sup> photography with simulated EOI photography, FROG would have to show about 30" - 40" GRD to give a product of value to photointerpreters "equivalent" to the EOI 26" GSD product. FROG is thus at least a factor 2 worse in its edge-of-swath resolution.

- 6. We believe that EOI design will not benefit from operational experience of FROG because such experience will not be available to any significant extent until mid-1975, and to delay the EOI procurement until then would postpone EOI operation to 1978 or 1979.
- 7. It is true that EOI has substantial growth capability which can be accommodated gradually in the present configuration.

Probably the improved capability of greatest interest is						

#### Summary and Conclusion

The comparisons (1) through (5) show the performance of FROG to be substantially inferior to that of EOI. The operation of FROG would only be an interim program. The longer EOI is delayed, the longer we will be denied the much superior EOI product, but we shall eventually develop the EOI system. Thus the question is not whether we spend \$675M or more (through 1977) to build FROG to fly end 1973 or or more (through 1977) to fly EOI end 1974. (The stated EOI program cost does not take credit for a saving exceeding \$100M annually, resulting from the replacement of G<sup>3</sup> by a very small fraction of EOI observing time). The question is whether it is worth \$675M additional to have an inferior product one year sooner (with substantial risk) and with what we regard as probable resulting delay of the superior capability.

The Panel believes that recent decisions have been based on two misconceptions:

- (1) that EOI and FROG are sufficiently similar in performance that the two are alternates, and
- (2) that the risk in developing FROG is substantially less than that in building EOI.

The Panel is unanimous in its judgment that the FROG program has the <u>higher</u> risk. We respectfully urge that FROG be dropped and EOI acquired on a schedule to result in first flight November 1974.
