MEMORANDUM FOR MR. LATIMER, OSD

SUBJECT: Intelligence Review Topics for the  
White House Working Committee

Attached are NRO inputs on the intelligence review problems identified for comment to the White House Working Committee. These inputs are in response to your tasking. Also attached, is a copy of our Organization and Management Paper which we forwarded earlier. It contains additional comments on our views toward the intelligence community structure above us, budgetary considerations, and some additional thinking on necessary security to protect the sensitive advanced technological development incorporated in our reconnaissance satellites. We also have attached a paper covering the "fact of" issue which has also been provided to the NSC Space Policy Committee. This paper may be helpful in analyzing that important issue.

  
J. W. Plummer

Identified Item 1.5

**SUBJECT: The Role of the PFIAB**

Over the years, the PFIAB has reviewed the NRO structure and was instrumental in establishing the present configuration. By establishing the NRO as a centralized management entity, the PFIAB demonstrated a unique ability to recommend an impartial and unbiased framework. This structure has served well to incorporate the DOD and CIA interests in space reconnaissance. Because of the individual talent of its membership, the PFIAB has brought much experience and impartiality to bear in viewing the intelligence community components.

We believe that the PFIAB should continue this role in the future with a goal of maintaining a non-parochial viewpoint.

Identified Item 4.3

**SUBJECT: Structured Versus Ad Hoc Requirements**

With respect to reconnaissance satellite development and acquisition, structured requirements emanating from the USIB have enabled the NRO to focus the longer range needs for program planning and acquisition purposes. By having a single source of requirements, the process is made less ambiguous and more straightforward. Annual updates of a structured five-year SIGINT plan, for example, have been beneficial in permitting a realistic application of scarce resources against reconnaissance satellite initiation or updates. For the near term, ad hoc requirements in terms of mission guidance should emanate from a sufficiently flexible central tasking mechanism so that time or situation dominated requirements can be satisfied. Of most significance to reconnaissance satellite tasking is the obtaining of a single set of community prioritized tasking levies. Ad hoc inputs from many sources would require that the satellite system operators set the priorities which might not be in the best interests of the community. For overall optimum development, acquisition and operation of reconnaissance satellites, a structured approach is most important in the longer term and extreme flexibility within a structured mechanism is most important in the shorter term.

Identified Item 5.1 through 7

**SUBJECT: Secrecy and Compartmentation**

There is a distinct tradeoff which must be made when considering the amount and ease of satellite product dissemination. Most of the satellite reconnaissance systems have a unique capability for data collection which cannot be replaced by another intelligence collection source. Therefore, inherent in a decision to relax dissemination security is an increase in risk of compromise of the function and the capability of the reconnaissance satellite vehicle.

Even though there are some shortcomings, the fact remains that the capabilities and limitations of our reconnaissance satellite systems have been protected, some for almost a decade. This degree of protection has been made possible only because of a highly conservative security policy and a psychological desire on the part of those knowledgeable of satellite systems to protect the sensitive detail.

The intelligence community should carefully consider the level of dissemination required of the raw intelligence product vis-a-vis information derived from the intelligence product. Utmost care should be maintained to preclude inadvertent or careless confirmation as to the capabilities and limitations of the satellite reconnaissance systems.

**ORGANIZATION AND MANAGEMENT  
OF THE  
SATELLITE RECONNAISSANCE PROGRAM**

**HISTORY**

Early in the 1950s it became apparent that the U.S. would experience increasing difficulty in mounting classical intelligence collection operations against the Soviet Union. The development of a Soviet nuclear capability significantly increased the urgency of the requirement for information concerning Soviet strategic forces. It was decided that overhead reconnaissance represented a feasible means of obtaining the essential strategic intelligence information.

Therefore, on 4 August 1955, after months of negotiations, the CIA and the USAF agreed to jointly sponsor and conduct the U-2 developmental and operational program. It was recognized that although the U-2 was initially highly survivable, the Soviets would eventually be capable of interdicting U-2 and other airborne overflight missions, thereby denying us the primary source of strategic intelligence.

Faced with the eventuality of losing our airborne reconnaissance capabilities, the USAF began the overt development of a reconnaissance satellite system in September 1956. This development became the SAMOS program.

As development activity on satellite reconnaissance systems progressed, it became apparent that openly operating a satellite espionage system would be inconsistent with the stated U.S. "space for peace" policy. In recognition of the potential international sensitivity to reconnaissance operations, satellite vehicles notwithstanding, the USAF and the CIA were made joint sponsors of a covert satellite reconnaissance program. Thus began the CORONA program under the cover of the DISCOVERER research project.

The incentive for development of an alternative reconnaissance capability heightened when on 1 May 1960 Gary Powers' U-2 was shot down on a mission targeted against Plesetsk. The President's decision to terminate overflights of the Soviet Union following the Powers incident essentially shrouded the Soviet Union until 19 August 1960 when the first intelligence photography was returned from space. Although the mission lasted only one day and returned comparatively poor quality imagery

(about 35 feet ground resolution versus the 2-3 feet for the U-2), a capability was demonstrated.

An NSC meeting had been scheduled for 25 August 1960 to review the management of the SAMOS program. The photography from the first successful CORONA satellite mission lent substantial evidence to the potential of satellite reconnaissance systems. The President directed the Air Force to reorient the SAMOS project along lines similar to the CORONA project, and to institute special streamlined management procedures.

A week later the Secretary of the Air Force delegated the management authority for satellite reconnaissance to the Under Secretary of the Air Force. It became increasingly apparent, however, that the importance of satellite reconnaissance products dictated that the collection program be conducted at a national level.

In September 1961, the Secretary of Defense and the Director of Central Intelligence signed an agreement establishing the National Reconnaissance Program. The agreement established the Under Secretary of the Air Force and the Deputy Director (Plans), CIA, as co-directors of the NRO. While this agreement laid the groundwork for succeeding NRP agreements, the NSC 5412/2 Group (now the 40 Committee) recommended against the co-directorship concept and in essence the agreement never operated.

On 2 May 1962, a second agreement was signed which established a single Director of the NRO and developed specific responsibilities and relationships governing requirements, project assignments, resources, and security.

On 6 July 1962, the NSC 5412/2 Group and the President's Foreign Intelligence Advisory Board non-concurred in the May 1962 Agreement and directed the development of a more definitive "permanent documentary basis for the National Reconnaissance Office."

On 13 March 1963, a third agreement was signed by the Deputy Secretary of Defense and the DCI. This agreement very clearly established the authority and responsibilities of the DNRO. While this agreement was more specific than the two previous attempts and was concurred in by the PFIAB, the agreement was considered unworkable by the CIA. During this period and until 1965, CIA and DOD relationships were at a very low ebb. Finally, in May 1964, following an intensive study, the PFIAB sent a memorandum to the President recommending that he approve a directive establishing a framework for the National Reconnaissance

which reflects several changes in the management structure such as the two-man ExCom, the enhanced role of NSA in the development of SIGINT reconnaissance satellites, and the removal of aircraft reconnaissance from the NRP. Program D, the aircraft program, was disbanded as of October 1974.

**PRESENT SITUATION**

There are several current factors at issue which affect the organization and management of the NRP.

The Tactical Support Problem. The President has placed the responsibility for providing national asset support to the military field commanders in the hands of the DCI. However, the intelligence community structure has not met this problem head on. There is a great deal of ambiguity relating to the definitions and the actual satisfaction of local commander requirements by the traditional nationally oriented reconnaissance satellites. There is a great desire, on the part of the Joint Chiefs of Staff and the DIA for example, to control the National Reconnaissance Program assets in the time of war. The current community structure makes this a difficult problem in terms of assuring that Defense priorities prevail in the time of war or crises.

CIA Involvement in the NRP. A significant characteristic of the NRP is the marked difference between the two major program offices of the NRP--CIA Reconnaissance Programs under the DDS&T and the Air Force Special Projects Office under a General officer. The CIA Program Office is very close to the intelligence community and has an excellent understanding of intelligence priorities and requirements. The CIA, while it recognizes the ultimate authority of the DNRO with regard to management of the NRP and his resource control, has tended to operate its programs nearly independently. The DCI and the DDS&T are continually involved in intelligence matters at every level of Government and with many agencies. Thus, the collection projects for which the CIA is responsible may receive attention in many discussions outside the NRO and beyond ExCom. This influence tends to restrict the options for the program decisions open to the DNRO.

Conversely, the Air Force Program Office is solely responsive to DNRO direction, since it reports in a direct line to the DNRO. This office is by geographic location (Los Angeles) and composition, however, removed from the intelligence

community and must look to the NRO Staff to interface with the appropriate USIB committees and the rest of the intelligence community.

The Senate Select Committee on Intelligence, among others, has raised a specific issue with regard to the CIA level of effort in the program management of reconnaissance satellites. Part of the discussion is focused on the nature of the DDS&T, his involvement in the total community and his unique position in influencing the requirements, the concept formulation, the acquisition, the operation and the evaluation of the satellites. There have been discussions which indicate that perhaps the role of the DDS&T in reconnaissance satellite activities should be diminished.

Resource Availability and Control. Traditionally, since 1965, the Executive Committee has established a level of effort for the NRP which has then been reviewed by the Senate and House Armed Services and Appropriations Committees. The level of effort has then been forwarded to the Congress within the President's budget but has not been subject to direct competition with other Defense priorities because of its prior special treatment and special nature. Recently, however, the process has been made more normal because of actions on the part of the Defense Department and the Congress. During the FY 76 budget approval process, elements of the NRP budget were placed in direct competition with other high priority Defense items. There is also an issue as to the location of the NRP budget, that is, whether or not it should be separated from the Defense budget and sponsored by the DCI as a part of a National Foreign Intelligence Program which would be appropriated to the DCI.

Retention of Streamlined Management. The NRO differs from an intelligence community element in the sense that the NRO is a management entity which furnishes the raw data product to the community for its use. The main rationale for having an NRO is to afford a central, streamlined management agency for the development and acquisition of reconnaissance satellites. The current NRP still retains most of the elements of streamlined management which were established at its initiation. The present structure permits streamlined management because of the small number of people involved and the use of special security as a management tool. The issue is how to restructure the NRP without sacrificing the management efficiencies which exist today. Any new charter for the NRO should contain sufficient safeguards and prerogatives to afford the continuation of the special management procedure. Otherwise, there would be a.

requirement for greater numbers of people and an increase in the appropriation needed for satellite development and acquisition.

CRITERIA.

With regard to the paragraph immediately above, there are several essential ingredients which should be imbedded in an NRO management organization structure. These are:

Single Responsibility. An NRO should have single governmental responsibility for reconnaissance and surveillance satellite development, acquisition and on-orbit operation. It should be located in the Washington, D.C. area for the maintenance of close contact with the intelligence community, resource managers, and the Congress.

Unambiguous Requirements. An NRO should not be a direct part of the requirements mechanism and the tasking authority. It should interface in the mechanism; however, for coordination and feedback purposes, there should be a single focal point to provide requirements for the NRO to satisfy.

Fenced Budget. An NRP should be established at the Executive level based on defined objectives. An NRO should maintain direct relationships with the Congress and maintain internal flexibility for reprogramming monies within the authorized budget.

Streamlined Decision Making. An NRO should be responsive to a single high level chain of command for its programs and budget. The Director of the reconnaissance satellite program should have the authority to make day-to-day resource decisions and call upon the chain of command as necessary. The Director should have total control over the operation of the field organizations and the contracting mechanism.

Limited Review. To assure streamlined management, a special review cycle should be used instead of the normal governmental review process, so that the normal bureaucracy does not impede the program's special activities. On the other hand, sufficient review should be provided at the higher levels to assure that the program is responsive to the requirements.

End-to-End Contracting. An NRO should contract for the total reconnaissance satellite system from concept development

through on-orbit operation and ultimate failure. Special reporting procedures should be incorporated in the contract mechanism.

Minimum Manning. An NRO should be kept small and low profile in its activities. Manning should be stabilized below the Director level to afford continuity. The organization should be multi-agency manned to provide balance between the Services and the intelligence agencies. Emphasis should be focused on maintaining a streamlined SPO concept.

Self Policing. An NRO should be responsible for internal controls over its operations and should call upon conventional audit or inspection agencies as required under the discretion of the Program Director. Special controls for audit and inspection should be maintained.

Security. A strong centrally controlled security system should be maintained in order to afford minimum program visibility to those outside the resource and user areas. A stringent access philosophy for the program to protect the sensitive technology, assets and operations which are inherently difficult to protect is required for extended periods of time.

**ORGANIZATION RATIONALE.**

The present NRO structure has worked well over time. The issues which led to the formulation of the combined DOD/CIA structure existed much in the same form then as they do today. Should a major change occur to the structure at the expense of meeting the criteria listed above which are essentially in effect today, great care must be taken so as not to void the efficiencies which have existed through the NRO since its inception.

Placement. The NRO should be a part of the National Foreign Intelligence Program, but should be responsive as well to the direct influence of the Secretary of Defense. At the national level, the NRP should be designated as a part of the National Foreign Intelligence Program and should be subject to the level of effort provided by a national ExCom which, as well, governs all elements of the National Foreign Intelligence Program. Once the budget level of effort is assigned, the Secretary of Defense should serve as the senior executive to assure that the management and execution of the NRP is in accordance with the budget assigned and that the various requirements are being satisfied. This overall concept is diagramed on Chart 1

Operations. Each project manager would be responsible for ground station management. Tasking of the photo satellites and SIGINT satellites would be in accordance with a central direction, emanating from focal points consisting primarily of NSA for SIGINT satellites and CIA and DIA for photo satellites. Each project manager would be responsible for the launching of the reconnaissance satellites and assuring that the product turn-over is in accord with the needs and desires of the community.

The rationale outlined above would afford a centralized streamlined management, assuming that there are proper security safeguards. It also affords the drawing in to the NRO those elements of the intelligence community and Defense establishment which are most interested and most expert in reconnaissance satellite development, acquisition, and operation without vested organizational interest. The environment of the organization permits the resources to be levied at a high national level and affords the DOD sufficient day-to-day management oversight within the national context. The internal NRO organization would be organized to continue a small level of manning and reinforce the streamlined decision making capability. With its civilian direction, proper checks and balances should be able to be realized so that the NRO provides a service of common need to the intelligence community.

"FACT OF"

"Should the U.S. Government publicly announce the fact that it conducts space reconnaissance activities?" The differing opinions regarding the answer to that question generate what is known as the "fact of" issue.

The proponents for declassifying and acknowledging officially to the world that the U.S. Government does, indeed, conduct space reconnaissance operations, have some logical arguments why the "fact of" should be declassified and released to the public. Some of the more significant reasons follow.

The "fact of" secret is, in fact, a non-secret. U.S. space reconnaissance activities have been reported in the world's press and on U.S. television. The argument is--why not reveal what is already publicly known to all? Since "fact of" is a non-secret, keeping it classified can be cited as a prime example of foolish (over) classification. Declassifying "fact of" would eliminate this absurdity. This declassification action would gain credibility for the government in general and enhance the intelligence community's image in particular. Lastly, there is an intuitive belief that overall consequences resulting from declassification would be positive and beneficial.

The opponents of declassification of "fact of" have equally logical arguments for their views. Some of the more significant reasons follow. The U.S. has already many times acknowledged its space reconnaissance role, e.g., the declassification and acknowledgement of the weather satellites and the warning surveillance satellites.  Further-  
more, declassification could result in varying degrees of adverse consequences including disastrous ones. Declassification would create new avenues for initiating actions where there is no basis for action now. For instance, the Soviets or Chinese could conceivably feel compelled to react to official acknowledgement of overflight of their state by U.S. espionage satellites. Adverse worldwide reaction could result in UN or other international bodies or third world nations making entreaties to the U.S. to curtail or cease space reconnaissance activities. It could encourage allies to request removal of ground based intelligence collectors since space systems collect intelligence that probably make the ground collectors less useful. The request for ground site removal alleviates political pressures.
