PACT SEELS

SUBJECT: Progress of Reconnelssance Development Projects (Project 920

PROJECT TITLE: CORONA (DISCOVERER)

Project ER 630-1171-1171-AT ED

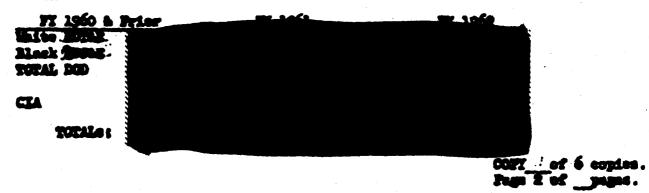

DEPARTMENT OF THE AIR PORCE AND THE CENTRAL INTELLIGENCE AGENCY

6 April 1961

- 1. Requirement: The project is in response to a requirement stated by the United States Intelligence Board, document 33-6/6, dated 5 July 1960, subject: Intelligence Requirements for Satellite Recommanded Systems of which SANOS is an Example. The desired ground resolutions are twenty (20) feet for search type missions, five (5) feet for target description, and one (1) foot for technical analysis. Repetitive coverage is desired and the frequency of coverage will be predicated upon; the state-of-the-art (reliability); the intelligence situation; availability of psyloads; boosters, etc.; and cost.
- 2. Type Vehicle: THOM/ACENA Space Booster combination.
- (a) Pirst Stage: Powered 2.5 minutes to 7600 down range. Oxidence is accomplished by a programmed outopilot.
 - (b) Coast Period: Power-off for 2.4 minutes to 300M down range.
- (c) Second Stage: Powered 2 minutes to 77000 down range. Ouidance accomplished by inertial reference.
- (d) Recrientation: The space capsule and payload is turned 180° to operational orientation (polar orbit) by gas reaction jets.
- (e) Operational: Orbital life is one to four days. Photography of the areas of interest is programed. Film capacity is 72-7600 feet of Thun-film or sufficient film to provide approximately 255,000 linear miles of photographic coverage.
- (f) Recovery: The space vehicle is re-oriented in orbit in order to allow retro-recluts to eject the capsule from the Agena in a reverse and dominant attitude. A paraclaste system is deployed to allow for an air match or sea recovery.
- 3. Praction: Covert satellite photographic recommaissance of the Soviet block and other desied areas.
- 4. Type of Activity: The present system is capable of accomplishing the search-type recornalseance mission (approx. 40 feet ground resolution).

- : 5. Operational Environment: Orbital altitude is 150-200 numbers miles. The recumulations system is limited to day (sum magle 12° or better) good weather equitions.
 - 6. Political Nevironment: Utilization of the system is dependent on Procidential approval. Approval may be obtained for a series of abote or may be required for each and every shot, depending on the political minustion at the time. Setallites are less limit to be affected by political considerations that would affect other recommunicance systems.
 - 7. Development Program: The camera development program is under the appairance of the Cla.
 - (a) Corona Busic (C): The basis commen has a St-inch focal length lens; uses seventy millimeter wide film, and operates in a peneronic mode taking pictures across the line of flight (180 miles wide). One successful recovery (this comment of film only) has been accomplished. Ground resolution of the film obtained was approximately forty feet.
 - (b) Corona Frime (C'): This is the second generation camera and is currently being flows. The camera is basically the same as the original, except for structural improvements and general engineering clean-up. One capsule (this camera film only) has been successfully recovered. The same general ground resolution was obtained; approximately forty fort.
 - (e) Corona Double Frime or Chl (C"): This country was a product improvement of the C". It was consolled in favor of a proposal for a Corona Triple Frime (C"') conservables the ETEK Corporation had developed as on "in-house" offert.
 - (A) Corona Triple Frime (C"): A new pinorance camera that utilizes the same space and cascatte as the C' camera. The C" incorporates a flexible plateon, revolving optics and new structural meterial. The file path incorporates air twists for turning the film in lieu of skewed reliers. The focal length of the lens is twenty-four inches and the lens operature is 2/3.5. The latter paralts the use of new fine grain films. The expected ground recolution is approximately 25 feet.

8. Pendings

Fact Short (Continued) Froj. Title: CONCRA(DIRCOVERNER)

9. Status: The C' assers vill be flow through Jone 1961. Operational restincts date for the C'' is July 1961. This vill allow for williestica of the slower finer grain films during the period of most feverable weather and non angle. Fourteen concress have been launched. Three of the recoveries have been successful. Due to a concre malfunction, film was not obtained from one of the recovered capsules.

Approximately 22,752 linear miles of photography have been obtained for a total of 4,288,412 square miles. Approximately 317,376 square miles of the coverage was duplicative coverage. (Total DESE equals 7,325,823 square miles). (See full information is obtained thru holes in clouds and areas of very thin cloud cover.

A proposal for a convergent stero installation of C". comerce is under consideration for a CY-1962 follow-on program. It is known from experience that the mallest steroscopically recognizable ground parallex is a factor of about 1/2 to 3/4 smaller than the smallest monomismiy resolved distance. Therefore, the expected ground resolution for this type of installation is 12 feet. All ground resolution figures previously quoted relate to object recognition. Resolution required for object identification is usually two times that required for recognition. In this case objects twelve feet on a side vill be recognised and objects twenty-four feet on a side vill be identified.

The current lames schedule is as follows:

Medica	ACTIA	Perlocal	_24_	Lernsk Date
90164	1106	A-2	5	8 April
9017	2107	C gardine	•	2 May
9018	1108	C prime	75-1	6 June
90194	1109	A-3	5	June 1961
9000	1110	C prime	•	July 1961
9021	1111	C triple prime	•	July 1961
9088A	1112	Art	5	July 1961
	1113	C triple prim	· •	Angust 1961
9083 ·	iii	4-5	75-1	August 1961
SORSA	1115	1-6	'5	September 1961
9006	1116	C triple prime	4	Ortober 1961
9027	1117	C triple prime	75-1	October 1961
9086	1118	C triple prime	5	. October 1961
9009	1119	C triple prime		Hevenber 1961
9030	1120	C prime	75-1	Bermber 1961

If the shows schedule is kept, there will be two unassigned C' constant (no vobiales) and three unassigned C'' constant.

COST__ of 6 copies.

Dags 3 of _5 pages.

Fact Sport (Continued) Froj. Title: CONCRA(NESCOVESIN)

10. Problem Areas: The lack of a common eccepted definition of resolution "in terms of the job to be done" has complicated the RAD evaluation process. The correlation of what an interpreter can see at various design resolution levels (film obtained from space) is not impro. An accounts and detailed evaluate of file obtained from space is required in order to determine what system resolutions will be required for specific jobs in the future. In order to establish a common reference, the following chart is week:

Types of Resolution Remple	Dog.	Rate Griteria	Design (MAD) Resolution	Capability and Status
Detection Musy	•	isvel A (50'-200')	201	E-2 (three arailable -10
Recognition Car	201	2010) 3 (10'-10')	81	C' (operational - to') C'' (operational in July- 20') Stores C'' (proposed CI 1962 - 10') B-6 (operational CI 1962
Mentifier- Type: Coupe tien or Selen	5'	[2'-8')	8,	3-5 (operational Sept 19

No funding.

Information currently available on E-6 camera does not indicate significant improvement over the E-5 and Stero C'''. It is possible that more effort should be placed upon development of a system with design resolution of 4 to 2.0 feet.

In order to insure that all efforts (R&D operational, economic, political, etc.) are properly placed, it is recommended that a detailed analysis of all over-flight (emphasis on space) film be conducted. The analysis

should determine the following:

(A) What information or intelligence did we obtain that was not already more (COMER, MINE, attaches, esbassies, agents, new main, ote.b

> of 6 comics. Jun 4 of _5 pages.

- (b) What information sen be obtained from photography that essent be obtained by other methods? Sow significant is this information in terms of stated requirements?
- (c) The degree of correlation that exists between photo intelligence and information obtained from other sources (to include the timing, simultaneous and month after, etc.)?
- (d) The contribution that each type of information makes to photography. (Note tells you what and where it is, ELLET tells you what is under the roof):
- (e) The degree that density indicators and rate of change indicators can be utilised in lieu of higher resolution. What questions will higher resolution ensuer?
- (f) Significant changes in ver plans that were accomplished as the result of new information obtained by photographic resonneissance only.
- (g) Based on everything that is known now and collection espabilities is being determine the relative value of each type of collection, recommend appropriate priorities, frequency of coverage and resolution.
